Hi Dave:

Congratulations on acquiring your 830S and your journey into CW. It is very rewarding.

To start, check that your IF shift is centered (12:00) and your VBT is fully clockwise (bandwidth fully open).

73,
  Brian (K7TKT)

Subject: [TS-520_820_530_830] TS-830S CW.N vs CW.W

HI,

I'm new to Ham radio and new to the Kenwood 830S recently acquired from a local SK. I have most of it figured out, though I'm pretty slow on tune-up.

I have decided to get into CW and started learning code. In the meantime I have been listening on 40M to some of the stations. When tuning to these I can easily tune with the Mode switch in CW.W but I get absolutely no signal on CW.N. I figure i must be missing a switch setting.

Anyone have a suggestion of what to check?

TIA

73,

Dave

Brian....

Great to hear you got things working....We have much in common...My contributions to this group are very little....I just do not have the experience....
what I have learned has enhanced my ham radio experience immeasurably...I fear there is not enough years in my life left to be much of a tech...but I do not hesitate to get dirty and trouble shoot problems with my hybrid gear....this is totally the result of the quality of the people here and their willingness to help..
I have and always will be thirsty for more knowledge....always take a couple of courses a year....some just for interest....some to keep my family safe
(advanced coastal navigation)....this I feel has been one of the best "ongoing" courses for anyone interested in electronics....
I echo your thanks.....Happy New Year to All..
Regards....Wes....VA6DWH

> Hi all:
>
> I've been lurking on the board since picking up an barely functional TS-830S a few years ago. My electronics experience is pretty limited but by reading the posts I've been slowly absorbing info. Shortly after I got the radio I sent it off for repairs and an alignment and it came back working but was still a bit of a disappointment.
>
> I've always thought my 830 was a little deaf. It got much better after I cleaned the antenna relay (based on advice from this group!) but my all-band entry level Yaesu still heard better. That just didn't seem right. My guess has always been that my 830 had taken a hard knock on the way back to me from being repaired and I wished I could perform the basic service at home to avoid the strain of shipping it across the country.
>
> Well, I have just finished my first alignment using the steps in the user manual and some of the information posted on the board. The change after the antenna/mix coil pack steps was dramatic. I picked up an average of 1 s-unit of calibrator level per band. I gained as much as 2.5 s-units on some bands. (No wonder it seemed deaf before...)
>
> The 830 now hears much better than my other radio...like I always thought it should. If it wasn't for the great information I've picked up over time here and the knowledge that if I goofed things up I could come here for support, I would probably not have taken this on. And the best part is that I understand the radio better now.

HI Dave,

I doubt you are missing a switch setting but I have to ask, are you sure the CW filter is installed in your 830? If you look on page 24, Fig 5-21, in the TS-830S operator's manual, you will see where and how the CW filters are installed. A simple visual inspection of this area on the IF Unit board will tell you if the CW filters are installed. It's no uncommon for sellers to remove filters and sell them separately from the sale of the TS-830S.

Yes. . .in order to use the narrow filter, IF ONE IS INSTALLED , the VBT must be fully clockwise. Not all 830's have the narrow filter installed.

Phil

Dave,

If you are referring to the CW filters in the 520 and 830 then no they are not the same, different IF frequencies.

The 520 has an IF frequency of 3.395Mhz while the 830 has 2 IF frequencies, first is 8Mhz followed by 455Khz so a filter from a 520 will not work in an 830.

Thanks Brian!

The VBT was it. I think it is the only knob or switch I didn't try.

Happy New Year to you all.

Dave

We are all full of "ignorance" :) I don't know if the 520 is similar but, if you need a manual for the 830 they are available online and on the Yahoo site for this group.

Hi Mike,

I did consider that the unit had been sold without the filters but was not anxious to tear into the hardware without getting an expert opinion. Thanks for the suggestion.

As it happens I had the VBT set at 12 o'clock and did not think to change it.

The good news I was listening to several clear signals this AM after opening the tuning up, VBT at 5 o'clock.

Thanks for your suggestion.

Happy New Year!

Dave

The TS-520 is factory wired to only select one filter. That is normally the SSB filter.

The CW filter installation instructions tell you to move the selection wire from the SSB filter to the CW filter.

But that always selects the CW filter.

To be able to switch between the filters mode switch needs to be rewired to add an separate wire from the switch to the CW filter.

I have a 520 sitting here with a CW filter sitting on top of needing the attention to update it. But since I have not had a problem with CW selectivity I have not taken the time to do it.

Hi Dave:

Great. I have been working on forming a better understanding (from a CW operators perspective) of how CW.W, CW.N, VBT and IF shift work for CW on my 830 of late. If you have a way to connect your headphone jack to a PC (you just need a male-male headphone cord and a size adapter) you can see the effect of these controls visually using free software called Spectrogram 5.17. It was very educational to me to see the the impact of each of these on bandwidth while keeping in mind that CW signals are normally around 800 hz in the passband.

My 830 has one 500hz CW filter. Viewing my bandwidth in Spectrogram helped me understand why having my IF shift set to around 10:00 worked best for CW. (Hint: If your IF is 12:00 (centered) and you narrow your VBT, that 800hz CW signal is no longer in the passband.) It also helped me see what narrowing VBT did when I was in CW.N mode and why I would not want to do this with only one CW filter installed. I guess I needed to see it to understand it. Very worthwhile.

I downloaded Spectrogram 5.17 from this site: http://www.w5big.com/spectrogram.htm Don't use the Visualization Software link...it's just adware now. Use the link for the old free version at the end of the first paragraph. It works great.

An interesting discussion of using the Spectrogram software can be found here:
http://groups.yahoo.com/group/TS-520_820_530_830/message/32474

I hope you enjoy your new to you 830.

Happy new year and 73,
  Brian (K7TKT)

Happy New Year to all,

As another lurker, just want to let all you "advisors", "mentors", and "Elmers" out there how much your counsel and encouragement is appreciated. You get us going and stay with us until the radio is playing. Brian's success is an inspiration to folks like myself that have been building up the courage and knowledge to open the case on our Kenwood. One of my NY's resolutions, that I intend to keep (really!! ;-), is to get my TS-830S on the Hybrid Net this year.

Thanks again!!

73,

Chris

Dave,
Congratulations on getting your TS-830S. The ts-830S is still one of the best out there. I have one and had quite a bit of CW fun with it last night. Straight Key Night is one night the bands are usually hopping and last night was no exception.

Don't be afraid to take the top cover off to check if all the filters are installed. If you have a manual it will show where they should be installed. See page 24 of the instruction book.
Just be sure to use a good properly fitting phillips screw driver and take your time.

Here is a link showing the inside with top off and no optional filters.

73,

Bill

Bob and all,
I knew some guys who used one of the less used switches , like the fixed chan selector , to switch the ssb filter in On CW mode. I never thought this was necessary.
I don't know if you are a Serious CW op (I think not) But when I bought my new TS520 as is at a close out price, got it home and hooked it up, it took about 30 minutes of operating before I got on the phone and ordered my 400 Hz CW filter, it was nearly unusable with a SSB filter on CW !!!!!

Adding the CW filter in the TS520 only takes about 15 minutes. Just remove the cover, just fasten down the new filter. Unsolder and move the brown wire. I don't think the 830s is any more work.

I feel the TS 520 cw filter switch mod is very necessary, especially if cw is your main mode. If you do the mod, switch the filter on and off on a weak cw contact, you will see the importance. The filter will knock out some stations completely. On the 830 and 520, if the band is not crowded, I don't use the filter. Especially dx on 15 meters.

There are many times you have to have a filter. Sometimes just to cut out the hash....

Hello Fellow Members, Happy New Year to you all.

I have recently acquired a Kenwood TS 830s Hybrid which is in reasonable working condition except that all the 10m
Band is completely dead on TX. None of the controls work on this band at all, but when I connected my signal Generator to the Antenna connector the set appears to have
quite acceptable RX levels on all segments of the 10m Band.
Prior to me diving into the set I thought I would post a message seeking advice from fellow members.
I note the plastic shaft coupler on the band switch has been replaced, It is possibly a re alignment problem?
Any comments/help would be appreciated.
Does anyone know of a source of 830S bandswitch wafers? (New or pre owned) just in case I require them.

Topic: 40422 Message: 40422

Hi All,

I have a TS-520 that I bought over a year ago. It was in great operational condition until recently. After a month or two of inactivity (had just been using it as a receiver, heaters off), I turned the heaters ON and soon after (few seconds??) a single loud POP sound was heard. I turned it off and it's been sitting there for weeks...

I know---I need to get brave and plug it back in to see if I can see any HV on the meter, etc. I didn't look before shutting it down. But for now, I'm wanting a bit more info before I power it back up...

At first I thought maybe a capacitor had exploded, but I can't see that with a visual inspection (and the spaghetti wiring makes me nervous about poking around too much). I did a bit of searching on the group here, and saw mention of "cathode resistor" but honestly, I don't even know where to look for that (even after looking over the service manual).

Any suggestions on what is the "likely suspect?" The old rigs aren't my forte, but maybe I can fix it with a bit of guidance from this informed group!

Thanks in advance,

Mark N8MH

I note the plastic shaft coupler on the band switch has been replaced, It is possibly a re alignment problem?
Any comments/help would be appreciated.
Does anyone know of a source of 830S bandswitch wafers? (New or pre owned) just in case I require them.
John.. ZL2BH

There is no output on 12, 17 and 30 meters on the TS830S I on my desk. The transmitter won't tune on these bands, but works fine on all other bands. The receiver works fine on all bands.

Any suggestion will be accpreciated.

Thanks.

OZ8CTH, Peter

Peter, You need to Enable the Warc bands. Must cut a Blue wire on the AF board.

73,
Gordon

Have you verified the presence of the 10 meter VCO signal at the RF
Unit's VCO terminal in transmit? It's possible the 10 meter VCO signal
is there but it's level at the transmit mixer is unusable.

You should neutralize anytime you change the final tubes.

It should be easier to do with 6146Bs.

And I agree - if the radio is working OK, don't fix it!

40439. Question regarding Final Drive Tubes.???

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-04 17:45:02 UTC
From: w9cac
Topic: 40439 Message: 40439

Having recently acquired a TS-520, my son and I decided to give the unit a thorough once over. Upon removing the cover over the final drive tubes, we noticed that there were a pair of S2001/A tubes in the sockets. Currently, we are getting about 110 watts out on SSB. The radio tunes up beautifully.
However, after some checking, we are still seriously confused as to what their replacements would be if we were ever to need them.
I have found sites that say it is ok to replace those tubes with 6146B's, other sites say that they need to be just 6146's, still other sites have stated that either 6146B's or 6146W's would be just fine.
Since our operational learning curve is still pretty high, I would really like some input here, so as to not equip our shack with the wrong tubes.

73"s Dave
W9CAC
P.S. Even data sheets show all three as a replacement. I understand that while the W's are military equivalents, they can be hard on the radio. Our application for the rig is as a base station, not mobile

The S2001/A are japanese variants of the 6146B.

Replace with either S2001/A or 6146B. Make sure to check/set neutralization when you replace.

Greetings group...well Happy New Year....

I have used 6146B's & 6146W's for replacing the 2001A's...I have NOT used the "A's" Both the "B's" & the "W's" have worked well for me. There is a good document in the "files section" of this board regarding the final amplifier tubes. Must make sure to neutralize per OP or Service manual. 110 watts on SSB is just a bit high...except MAYBE on the lower bands. I think that using a known calibrated meter you would see100 watts. For proper SSB power out reading...the meter has to be able to "read" the average RF envelope. If you are jacking up the mic gain or jacking up the processor...you may indicate 110 watts..but causing splatter. IF the 2001A's are putting out rated power out...there is no need to replace them...I have an 820S that still has its original 2001A's. PLEASE be careful...I have not had good luck with the "ASIAN" market tubes...I used a set once...one or both arced over..popping the cathode resistors...not much of a problem on the 520/820 series to replace....but on the 530/830...a real pain the the *&$@.

Due to inflation....that's my 10 cents worth

The S2001/A are japanese variants of the 6146B.

Replace with either S2001/A or 6146B. Make sure to check/set neutralization when you replace.

Subject: [TS-520_820_530_830] Question regarding Final Drive Tubes.???

Having recently acquired a TS-520, my son and I decided to give the unit a thorough once over. Upon removing the cover over the final drive tubes, we noticed that there were a pair of S2001/A tubes in the sockets. Currently, we are getting about 110 watts out on SSB. The radio tunes up beautifully.
However, after some checking, we are still seriously confused as to what their replacements would be if we were ever to need them.
I have found sites that say it is ok to replace those tubes with 6146B's, other sites say that they need to be just 6146's, still other sites have stated that either 6146B's or 6146W's would be just fine.
Since our operational learning curve is still pretty high, I would really like some input here, so as to not equip our shack with the wrong tubes.

73"s Dave
W9CAC
P.S. Even data sheets show all three as a replacement. I understand that while the W's are military equivalents, they can be hard on the radio. Our application for the rig is as a base station, not mobile

True - I should have mentioned 6146W. They work fine. That is what is currently in my 530S.

Subject: [SPAM] Re: [TS-520_820_530_830] Question regarding Final Drive Tubes.???

Greetings group...well Happy New Year....

I have used 6146B's & 6146W's for replacing the 2001A's...I have NOT used the "A's" Both the "B's" & the "W's" have worked well for me. There is a good document in the "files section" of this board regarding the final amplifier tubes. Must make sure to neutralize per OP or Service manual. 110 watts on SSB is just a bit high...except MAYBE on the lower bands. I think that using a known calibrated meter you would see100 watts. For proper SSB power out reading...the meter has to be able to "read" the average RF envelope. If you are jacking up the mic gain or jacking up the processor...you may indicate 110 watts..but causing splatter. IF the 2001A's are putting out rated power out...there is no need to replace them...I have an 820S that still has its original 2001A's. PLEASE be careful...I have not had good luck with the "ASIAN" market tubes...I used a set once...one or both arced over..popping the cathode resistors...not much of a problem on the 520/820 series to replace....but on the 530/830...a real pain the the *&$@.

Due to inflation....that's my 10 cents worth

Thanks guys for the info. after reading the info on neutralization of the finals, I worked backward through the manual and found a little two line sentence that stated to replace the S2001/A's with 6146B's.
Funny how that works sometimes. Well, I will now order what we may need in the future.
Thanks for the help.

Joe,
Thanks for the advice. We used a general commercial type watt meter my son has, it could be off in itself, don't know the last time it was calibrated. We followed the tuning instructions and avoid over-driving the processor. We are being as conservative as we can. We plan on this rig lasting a long time. We also plan on spending the money for a good matched set of "American Labeled" tubes just to be sure we have good stock in the event we need them. We do not foresee a breakdown problem for these tubes any time soon though.

Dave,

  No problem. However, there is NO reason to use "matched set" final tubes here...they are not necessary and you pay a premium price. There has been lots of "discussion" regarding this subject...and most seem to agree that it's a waste.

   Again, due to inflation....my 10 cents worth.

Subject: [TS-520_820_530_830] Question regarding Final Drive Tubes.???

Having recently acquired a TS-520, my son and I decided to give the unit a thorough once over. Upon removing the cover over the final drive tubes, we noticed that there were a pair of S2001/A tubes in the sockets. Currently, we are getting about 110 watts out on SSB. The radio tunes up beautifully.
However, after some checking, we are still seriously confused as to what their replacements would be if we were ever to need them.
I have found sites that say it is ok to replace those tubes with 6146B's, other sites say that they need to be just 6146's, still other sites have stated that either 6146B's or 6146W's would be just fine.
Since our operational learning curve is still pretty high, I would really like some input here, so as to not equip our shack with the wrong tubes.

73"s Dave
W9CAC
P.S. Even data sheets show all three as a replacement. I understand that while the W's are military equivalents, they can be hard on the radio. Our application for the rig is as a base station, not mobile

Final tubes are originally S2001, A Japaneese number for a 6146 tube.
You said "drive tube" ? a Driver tube is the small 12BY7 type , the Finals are the two bigger 6146 type tubes in the final amplifier circuit..
I agree a "matched pair" would be nice for a push-pull modulator for an QM rig but NOT so for the parallel circuit used in the RFPA finals. Two new tubes is close enough in spec as long as they both thav the same number and letter, as in two 6146 tubes or two 6146A or two 6146B tubes etc...
By the way I replaced my TS520 S2001 tubes with 6146B's at the 15 year mark and they have been running since then with no loss of performance. I bought this rig new.

Dave,
  No problem. However, there is NO reason to use "matched set" final tubes here...they are not necessary and you pay a premium price. There has been lots of
"discussion" regarding this subject...and most seem to agree that it's a waste.

   Again, due to inflation....my 10 cents worth.

Joe,
Thanks for the advice. We used a general commercial type watt meter my son has, it could be off in itself, don't know the last time it was calibrated. We followed the tuning instructions and avoid over-driving the processor. We are being as conservative as we can. We plan on this rig lasting a long time. We also plan on spending the money for a good matched set of "American Labeled" tubes just to be sure we have good stock in the event we need them. We do not foresee a breakdown problem for these tubes any time soon though.

I ruined the first set of 6148B tubes I installed in my TS-830. Not sure if they were Asian or Russian, was several years ago. When I purchased the next pair from R&L Electronics in Hamilton, OH, the salesman informed me he had experienced the same problem. They found out that the original American tubes were "burnt-in" prior to sale, The Asian/Russian tubes "were not". I was told to use the new tubes at low power and slowly increase output. I run about 25 watts out on CW for aprox. 30 minutes air time and then each time slowly increased to full 100 watts output. This pair worked fine for several years until I sold the Rig. Good Luck---Dick, AA8YN

I agree. The 520 will typically produce between 90 and 105 watts output.
Trying to push the finals for a higher output will only lead to
early/shorter life span for the final tubes and a lot of distortion in
the output signal that will create splatter and adjacent frequency
interference.

A watt meter is not needed to know what the final amplifier's input and
output power levels are when the final amplifier is properly tuned.

Hi all and HNY
I've just had this transistor (Q8) literally blow apart in my TS520. Has anyone had experience of finding a suitable and readily available replacement; and what might be the most likely cause of the failure?

Another point to consider here: Let the tubes loaf along at 90 or so watts. The op at the far end will not hear the difference in power, and you pretty much avoid any possibility of overdriving and killing off the final tubes. Even at 50 watts output, you only lose 3 dB..barely detectable at the other end of your QSO.

As to the other question of the 50 watt limit, as I recall, you can pull one of the final tubes. I realize my memory is not perfect, but should that second final be pulled, VOILA! Instant spare final!

Topic: 40458 Message: 40458

I am in the process of re-caping my ts-820. I removed the IF board (x48-1150-00)some time ago to replaced the caps, but was one short. I am now ready to re-install the board, but the molex connectors don't seem to line up, so I need to know how to correctly connect them. Connections are as follows: IF1, IF2, IF3, IF4, and IF5. IF2, IF3, IF4, and IF5 are no brainers. It's IF1 that I have a question about. The board has 7 pins and there are two molex connectors each with 3 pins, so if someone could let me know how IF1 is connected I would greatly appreciate it. I am looking forward to finally get this rig back on the air after 20 plus years in someones closet.

From: Joseph Stiles
Topic: 40458 Message: 40459

connect as follows: IF1.... when looking at component side of board and edge connectors down...IF-1 should be on the left lower corner.

Find the 3 pin connector with the grey colored small diameter shielded cable...one "hole" will be empty...plug into
the RF (empty) GND pins. The small center conductor should be farthest right

Locate the 4 pin connector.....WHITE-GREY-ORANGE-GREEN-WHITE w/grey stripe... this connected right next to the
connector above

Next would be GREEN-VIOLET-GREY....whether it is placed right next to the 4 pin connector above or not ...depends on
how you want to select your filter combo...check your operators manual.

Jose,

I have used "matched pairs" on a couple of my real old broadcast band/ shortwave receivers..in the audio amp section of the old upright "nice piece of furniture" type...built circa 1934 to 38. My brother-in-law uses matched pairs on his high-end guitar/audio amp.

Hello group. I am a newby to hybrid radios. I received my first TS-830s yesterday and took the covers off to see if I could see any obvious problems. I found one of the HV caps had leaked at some point. I have ordered a replacement cap kit and will replace them when they arrive. I also noticed on receive that USB sounds good (maybe a bit bassy, but completely readable), but LSB is very tinny, like it had a cw filter on it.
Has anybody here had this issue? And if so, how have you fixed it?

Have you looked at the front panel IF Shift and NOTCH control on the front panel? They should have their knobs pointing at 12 o'clock or at the detent felt when rotating the knobs.

Do you have the 830's operator manual? If not then I recommend you download it, free, from Gordon's website, see link below

www.n6wk.com/kenwood/

then take the time to read it before you operate the 830. Many operating questions can be easily answered by reading the operator's manual.

I don't mean any disrespect but this is a common mistake made by many hams today. They either do not read the manual that came with the radio or they don't attempt to download the manual or locate and purchase the manual that didn't come with the radio. Many operating questions can be answered by taking the time to read the manual before attempting to operate the radio.

Did you check the rear panel's "RF VOLT" pot setting? This procedure is discussed in the 830's operator's manual on page 12.

If the meter still doesn't move after adjusting the RF VOLT pot on the rear panel then it's quite possible diode D9 (1N60) may be open.

Robert,
Check out Kenwood Service Bulletin #2, dated 10-01-75 located here:

http://wb4hfn.com/KENWOOD/Articles/SERVICE%20NOTES%20-%20ALL%20HYBRIDS.pdf

Or you can simply control the ALC via the
Auxillary socket on the rear panel with this simple modification:

http://vss.pl/mods.dk/mods.php3-radio=kenwood&model=ts-520&selectid=739.htm

Regards,
Mark

Topic: 40422 Message: 40470

Hello Again,

Well, so far, only 1 reply off list. I'll try again, with some updated information about my TS-520.

Last night I did another visual inspection of the radio and saw that two 10 ohm resistors (pretty hefty--a watt or two rating?) were cracked and needed replacing; one literally fell in half with a gentle touch. Each final tube socket had one 10 ohm resistor connected to ground. I replaced them both with even larger old style 10 ohm resistors (it's what I had on hand).

In testing the rig, it appears to "tune" up OK, and all appears normal except that it's only putting out a fraction of a watt or so. I double checked the SG switch on the back and it is UP. High voltage looks OK (about 900V as a I recall) and drops a bit when the heater switch is turned ON; no more popping has been heard.

So based on the single loud POP when I turned the heater switch ON--is likely to be the high voltage caps? Or any other suggestions on what to inspect/test/replace next? I can tell that getting th0se out of this old rig is going to be a real challenge...if it was really easy, I'd have done it already...hi hi.

I have spare tubes (driver and finals) but don't want to just swap them out...my hunch is that it's something else.

Again, I'll appreciate some advice :)

73,

Mark N8MH

Hello Mark,

Sorry I missed your post. A bunch od us check this each day but somehow I missed your post.

First of all I would suggest you check on K4EAA's website or Jim Showkers web site for a lot of info on these Hybrids.

The Res you describe is most likely the cathode resistors. they are 1 watt. You should also check and most likely replace the screen resistors as well and do not forget the one on the rectifier board. If you check on K4EAA's website there are several explanations and photos that will help you get a piture in you mind. It may be a good idea to go thru the HV circuit and make sure all your voltages are correct. Do not forget to discharge the HV caps before playing in that area. I do not know your skill level or experience with these Hybrids but it is a good idea to read all you can before jumping in. May save some components and prevent sparking out of the Ham community early. I think the 2 websites will be a great help. Jim's website is hybridrestore
73 and have fun with the 520. Don K5HFG

Thanks, Don.

My skill level with the tube radios is very low (beginner), but I'm trying. Thanks for the high voltage reminder!!

I have combed through both sites and been reading things off and on for the past year. I did buy a complete recap kit from JIm S. and also got the "resistor kit for final section." Last night when replacing those two broken resistors, I was pretty sure the 10 ohm resistors in the resistor kit were the right ones, but I chickened out because there were SO small, and decided to use the old style resistors on hand because they more closely resembled what I was replacing.

I see the "resistor kit" includes the necessary screen resistors; now I have to find them ;) I'm really struggling with matching up what I see in the radio with what is in the circuit diagrams and small schematics. Guess that's part of the process...

What is setting me back is my reluctance to "jump right in" due to all the wires with little slack in them, and without any connectors or headers. I'm being a chicken I guess.

I am aware I could send it off for a full restore/recap, but that amounts to about $500-600! Not sure I like the rig that much..hi hi.

Thanks again for the safety reminder and pointers to info.

73,

Mark N8MH

Mike, No disrespect taken! I DL the manual soon after I got the rig. I also have DL'd the 830s Survival Guide. I will be reading thru those this weekend.

No problem Mark. You have to dig in these old Hybrids. If you remove some of the tie wraps from the wire bundles it is easier to get at the wires you need to. You can replace the wraps after you finish. It helps to tag each wire you remove for quick reconnection and also reminds you to reconnect. I use yellow vinyl tape and look around for it before I close up. It has been a puzzlement saver many times.If you are in the final section, take a moment to look between the 6146's. At the top of that long RF choke you see a metal divider. Take long blade phillips screwdriver and place the point on the chasis and lean the shaft against the divider to discharge the HV. Make sure you are not touching the shaft. wrap a screwdriver with vinyl tape and keep it on your bench in the open just for this one job.Do this each time you get into the final cage. Whether the rig was just turned off or if it has been sitting for awhile. After awhile it will become a GOOD habit and you will not become a giant resistor!! We stress this safety constantly because it is easy to forget that there is enough amperage in there to KILL. Go ahead and crawl into it! If you run into any problems there are many in this group to help you. Do not get discouraged if your post is not answered immediately, many of us are still in the work force and we can not get to it right away. You may notice that answers seem to come all at once. That is when most everyone has some spare time to pursue our hobby. Don K5HFG

> >
> > KD6FSK
> > Rob

I found some 6146 tubes in a misc (all items $1) box at the local hamfest so I grabbed up a few. An Elmer said the differences between a/b/and w's when they first came along. The A's were a little tighter to tune would have a litter higher output but were not very long lasting (140watts+ can be tuned with them) B's were the average of tuning and longevity. And The W were for actual mobile rigs when you had the 520 mounted in the t model bouncing down the dirt main road or out cutting firewood and needed a way to talk back to the base. With less output (aprox. 70W) but were more robust.

Just as a reminder, be sure your meter and any other test equipment
you're using in there is rated for at least 1,000 volts! It'd be really
easy to blow up a nice DVM or VOM in that section of the radio.

The "Heater" switch has nothing to do with the HV filter capacitors failing.The sole purpose of the "Heater" switch is to apply filament voltage to the driver and both final tubes.

Improper tuning, abuse by a previous owner(s), aging capacitor, or all 3 most likely have contributed to the failure of the HV filter capacitors, not by simply turning the HEATER switch ON.

You said your skill level for tube radios is low (beginner). Based on that information Irecommend you do some studying first before you attempt any service on your 520. I recommend you obtain an early edition of the ARRL Handbook, mid 60's for example, and study Vacuum Tube and Amplifier Class topics. You can find the handbooks on eBay or your local library. You can't successfully service vacuum tube circuits if you do not understand how vacuum tubes and amplifier classes workand that information is contained in the ARRL Handbook.

I also recommend obtaining the book

BASIC RADIO COURSE
Author: John T. Frye

and study it from cover to cover. This book is out of print but quite often can be found on Amazon.com (used), at used book stores, or eBay. Amazon.com currently has one (used) available for $4.99 plus shipping. This book is written in simple text withpictorial examples of subjects covered along with a few questions at the end of each chapter to ensure you understand the chapter's subject matter.

These books contain an wealth of information.

Also, if you don't have it, download the TS-520's Service Manual from Gordon's website

www.n6wk.com/kenwood/

Once you download the service manual, take some time and study the "Circuit Description" sectionand block diagram so you get an idea of how the 520 works. You can't successfully service the 520 if you do not know/understand how it works inside.

Once you have these books, take some time and studybefore you attempt to service your 520.

Robert,

Frankly, I wouldn't worry. No one is going to care much if you are tx'ing on 100w, even on a foundation licence, let alone an intermediate, unless you cause interference locally. And that's from the President of the RSGB.

Mark,

One item to look at for the 6146's is the solder joints for the tube sockets. I have had a few solder joints form cracks on my 830. The self-heating of the tubes will age the solder over time.

73's.....de NU8M....John

Thanks, John. I'll put this on my "check" list...

Mark,

The BASIC RADIO COURSE by John T. Frye is about the best, easy to understand, book on basic and intro to advanced electronics I have found. It's written in easy to understand text.

The ARRL handbooks are good but the current editions are written, in my opinion, in text that might be a bit more difficult to understand. That's why I recommended the earlier editions, mid 60s.

What you can do is purchase a VTVM on eBay, most are inexpensive and most of them work. In many cases all that's needed is to replace the 1.5VDC battery and clean it up. Some VTVMs don't come with the probes but the probes are easy to make. You can purchase some resistors and a 9 volt battery and perform some of the simple experiments using ohms law, calculating current (I), voltage (E), and Resistance (R). You will use that VTVM more than you think, especially during alignment where an analog meter performs much better than a DVM.

sorry I didn't reply right away ... I had got this rig from another operator , and when we were talking about making the deal he said that it received fine , but it's transmit wasn't very good at all . So I made this post while I was waiting for the radio to get here. The radio just arrived , it's extremely cold from riding in the delivery truck all day ... but I took a look inside to see what I could find out , and this is what I found (so far) : I found a batch of wires that appear to be coming from the digital frequency counter that was unplugged ... and then after looking around a bit more , I found that the 12BY7A driver tube wasn't plugged into it's socket .

Hi Jimmy
Thanks for this information. I will replace the diode at the same time. I just checked Mouser and they are not selling the NTE290A via web orders at this time. If anyone else has found a suitable substitute I would be pleased to hear from you.

Further to my last post I think I have found a supply of NTE290A and the diodes in this part of the world - I wont be sure until tomorrow (monday here).

Hello again,

I took a second trip into my basement flea market and this time I came up with a copy of the John T. Frye, Basic Radio Course. I also was lucky enough to find a second Frye book, Radio Receiver Servicing dated 1955. Frye also wrote the Carl and Jerry short story series (a little like the Hardy Boys or the Radio Boys) for Popular Electronics in the 1950's. Thanks for all the help in locating a copy of the book as well as the support for retirement goals.

Happy New Year de W8EO.

73,

Ed, W8EO

From: John Elvy
Topic: 40420 Message: 40492

Hi Mike,
Thanks for your suggestion I have disconnected the lead from the RF Board aand connected my freq counter onto the end of the lead and with the band switch set to 10m (28.800mhz) i recorded a RX freq of 37.6315 Mhz and 37.6307 Mhz on TX.
I don't have a scope so as best i could determine with my multimeter the level was similar to that on 14mhz.

There are two quite solid white wires leading into the PA cage, the one coming from the near the driver tube has in the order of 4.6v (using my MM) on both 14mhz and 28mhz when the send switch is activated.

My eyesight is not flash, but looking into the PA cage i noted that several capacitors have been replaced reasonably recently, it also appears that the PA bandswith assembly may have been removed and possibly dismantled?

There is limited vision available to inspect the PA wafer switch but I suspect that this is the problem area. Perhaps it's a faulty wafer, a shorted terminal, or wrong reasembly like a reversed wafer?

I have checked the switch alignment on 10Mhz as suggested within the files section and this was correct.

I would like to get the 830 going on 10m if possible if for no other reason than to neutralise the tubes properly as per the manual....

If indeed i have to dismantle the PA section then i would like to have all the info i can to hand along with a spare switch or wafers if i can locate the same.

Do you know if the PA wafer switches are the same in all the kenwood hybrid series?

I think my next move will be to get a schematic of the PA section blown up and printed so i can work my way systematically through this section.

I may be barking completely up the wrong tree but i'm sure the problem lies in the PA switching area possibly a result of repair work?

Any help/advice from any source would be gratefully received..

Regards,
John ZL2BH

Have you verified the presence of the 10 meter VCO signal at the RF
Unit's VCO terminal in transmit? It's possible the 10 meter VCO signal

is there but it's level at the transmit mixer is unusable.

Hello Robert,
Welcome to the Group.
I am a new member as well.
I have found the “files Section” well worth the time to investigate, it improved my knowledge on aspects of these ‘Hybrid Rigs” no end.
I recall seeing information about power reduction but from memory it was down to QRP level but perhaps the basic principal is the same?
I have found members to be very helpful, I’m sure you will receive the help/advice you require...
Regards,
John.. ZL2BH

Dave,

No problem. However, there is NO reason to use "matched set" final tubes here...they are not necessary and you pay a premium price. There has been lots of
"discussion" regarding this subject...and most seem to agree that it's a waste.

Again, due to inflation....my 10 cents worth.

Joe,
Thanks for the advice. We used a general commercial type watt meter my son has, it could be off in itself, don't know the last time it was calibrated. We followed the tuning instructions and avoid over-driving the processor. We are being as conservative as we can. We plan on this rig lasting a long time. We also plan on spending the money for a good matched set of "American Labeled" tubes just to be sure we have good stock in the event we need them. We do not foresee a breakdown problem for these tubes any time soon though.

There is a good document in the "files section" of this board regarding the final amplifier tubes.Â Must make sure to neutralize per OP or Service manual. 110 watts on SSB is just a bit high...except MAYBE on the lower bands. I think that using a known calibrated meter you would see100 watts. For proper SSB power out reading...the meter has to be able to "read" the average RF envelope. If you are jacking up the mic gain or jacking up the processor...you may indicate 110 watts..but causing splatter. IF the 2001A's are putting out rated power out...there is no need to replace them...I have an 820S that still has its original 2001A's. PLEASE be careful...I have not had good luck with the "ASIAN" market tubes...I used a set once...one or both arced over..popping the cathode resistors...not much of a
problem on the

I remember reading in the TS-820S manual how to change one of the tubes with a "dummy" to reduce the output to U.S. novice levels (which I believe was also 50w). I'm not sure how the dummy tube was wired, or if it would be something to easily make, but it might be worth looking into. You could probably try looking online for info.

On the other hand, if your licensing is anything like ours is here in the U.S., it might be easier to upgrade to a higher power license than to modify your radio. :)

Mark,

  Your final tubes may have totally failed. Is what ever watt meter you are using is it KNOWN good/accurate? IF as you say it "tunes up ok but only puts out a fraction of a watt" do you have good HV AND proper Ip at key down? And YES, the newer resistors are really physically smaller than the "old style." Take a look a modern capacitors!You should always stick with the correct ohm value AND watt rating when dealing with the resistors in the HV, rectifier, and the final amplifier tube circuit board. They "act" as a fuse...hopefully "popping" and protecting the tubes..and some other stuff. Ken Kemski.. k4eaa.com has a good section on this.
One of the main reasons that the cathode resistors fail is due to one or both final amp tubes failing for what ever reason. I suggest that you obtain a known good set of finals and a good driver to keep for testing/diagnostic purposes. I still think you are going to need new final amp tubes.

Subject: Re: [TS-520_820_530_830] TS-520 - heater ON, then loud "POP!"

Hello Again,

Well, so far, only 1 reply off list. I'll try again, with some updated information about my TS-520.

Last night I did another visual inspection of the radio and saw that two 10 ohm resistors (pretty hefty--a watt or two rating?) were cracked and needed replacing; one literally fell in half with a gentle touch. Each final tube socket had one 10 ohm resistor connected to ground. I replaced them both with even larger old style 10 ohm resistors (it's what I had on hand).

In testing the rig, it appears to "tune" up OK, and all appears normal except that it's only putting out a fraction of a watt or so. I double checked the SG switch on the back and it is UP. High voltage looks OK (about 900V as a I recall) and drops a bit when the heater switch is turned ON; no more popping has been heard.

So based on the single loud POP when I turned the heater switch ON--is likely to be the high voltage caps? Or any other suggestions on what to inspect/test/replace next? I can tell that getting th0se out of this old rig is going to be a real challenge...if it was really easy, I'd have done it already...hi hi.

I have spare tubes (driver and finals) but don't want to just swap them out...my hunch is that it's something else.

Again, I'll appreciate some advice :)

Peter,

   Try cleaning the meter switch also...and also the RF VOLT control as Ken stated. It is not unheard of...but the small diode in the final cage that is soldered on the terminal strip may have failed....it is used to detect the RF output for the meter...its hard to see...but if you remove the fan it makes it easier.

Joe,

Thanks for the response. I now understand my mistake, and thanks for pointing out the reference in the manual that I obviously missed.

I do not recommend doing that, dummy tube or not. Removing one of the final tubes will change the plate resistance of the circuit. The final amplifier circuit is designed around 2 final tubes not just one..

Although not mentioned, I do not recommend adjusting the LOAD control to reduce power input/output. If the LOAD control is adjusted to lower power input/output then the PI Network's output impedance is no longer a close match to the load present (antenna tuner, antenna, or dummy load) at the antenna connector.

As far as I recall it was a simulated filament load resistor because the 6V final filaments were in siries across the 12 V source..

I remember reading in the TS-820S manual how to change one of the tubes with a "dummy" to reduce the output to U.S. novice levels (which I believe was also 50w). I'm not sure how the dummy tube was wired, or if it would be something to easily make, but it might be worth looking into. You could probably try looking online for info.

On the other hand, if your licensing is anything like ours is here in the U.S., it might be easier to upgrade to a higher power license than to modify your radio. :)

John,

If you can advise on which caps have been changed on S22 wafer switch in PA. I have experience with those caps. But again make sure you discharge the HV first

Subject: Re: [TS-520_820_530_830] TS 830S Faulty on 10 Metre Band

Hi Mike,
Thanks for your suggestion I have disconnected the lead from the RF Board aand connected my freq counter onto the end of the lead and with the band switch set to 10m (28.800mhz) i recorded a RX freq of 37.6315 Mhz and 37.6307 Mhz on TX.
I don?t have a scope so as best i could determine with my multimeter the level was similar to that on 14mhz.

There are two quite solid white wires leading into the PA cage, the one coming from the near the driver tube has in the order of 4.6v (using my MM) on both 14mhz and 28mhz when the send switch is activated.

My eyesight is not flash, but looking into the PA cage i noted that several capacitors have been replaced reasonably recently, it also appears that the PA bandswith assembly may have been removed and possibly dismantled?

There is limited vision available to inspect the PA wafer switch but I suspect that this is the problem area. Perhaps it?s a faulty wafer, a shorted terminal, or wrong reasembly like a reversed wafer?

I have checked the switch alignment on 10Mhz as suggested within the files section and this was correct.

I would like to get the 830 going on 10m if possible if for no other reason than to neutralise the tubes properly as per the manual....

If indeed i have to dismantle the PA section then i would like to have all the info i can to hand along with a spare switch or wafers if i can locate the same.

Do you know if the PA wafer switches are the same in all the kenwood hybrid series?

I think my next move will be to get a schematic of the PA section blown up and printed so i can work my way systematically through this section.

I may be barking completely up the wrong tree but i?m sure the problem lies in the PA switching area possibly a result of repair work?

Any help/advice from any source would be gratefully received..

Regards,
John ZL2BH

Have you verified the presence of the 10 meter VCO signal at the RF
Unit's VCO terminal in transmit? It's possible the 10 meter VCO signal
is there but it's level at the transmit mixer is unusable.

John,

You can give the s22 and all of the wafer switches a good blast of deoxit and then a good blow out with compressed air. Have a close look at the wafer switches on the RF board and as you roatae through each position on the band switch see if the little brass fingers are connecting, if they are ben out, simple matter of using a plastic screw driver to push back in. This is done with the radio off and HV discharged

Thanks for the reply, Joe.

I'm using a Diamond SX-1000 meter. While not a Bird, I do have reasonable faith in it, even at the 5W full scale setting. I can see a something like 100-200mW or so that peaks and dips when the rig is tuned. It's less than 1W, anyhow...

Further, I can monitor the signal on my TS-2000x. It too shows a transmitted signal that is on frequency, stable, that peaks and dips when tuning up the rig (did that on 20M into a matched antenna). The audio even sounds just fine SSB.

As I recall,when toggling the transmit switch, the HV reads just under 900V (close to that). Idle Ip is set to 60mA per manual. Really, other than the tiny power output, as an operator I would think all is well!

So, in my rather uninformed opinion, it "acts like" the final tubes are bad. I printed off lots of pages last night, from the files section. One of them walks through how to check the tubes with an ohm meter. That is on my to-do list today.

What I clearly don't want to do is swap tubes and hear a loud POP again ;)

I appreciate everybody's help!

Warning, long post.

Dave, these 'regs' were not developed over may years, they were introduced just a few years ago in the UK. And in the case of the licence class power restrictions, they largely ignore the real world.

In broad terms, the Foundation (novice) licence is limited to 10W, Intermediate to 50W, Advanced to 400W.

There is no requirement to produce a licence to purchase/own radio equipment capable of output in excess of the class of licence. There is no restriction on the power output of any marketed device.

The power restrictions are concerned with the power at the RF output. If you have a huge feed loss and an inefficient antenna, it matters not. Conversely, if you have a high gain antenna system, and can thus increase your ERP, you can legally transmit 'in excess' of the licence limit...

The licence classes have virtually no emphasis on operating procedure; the bulk of the exam/teaching being electronic theory, then a mash of callsign allocation (and the madness of UK regional identifiers and confusing maritime, mobile, and portable suffixes), TVI, and licence conditions. Even dafter is the concept of changing callsign identifiers to reflect the licence class, whilst callsigns are issued 'for life'. Thus, someone will always be M3xxx or M6xxx on a foundation licence, then 2Exxx as an Intermediate licencee, then M0 or M1xxx when advanced. Even dafter, if, as an advanced licence holder, I wished to use my M3/M6 callsign, I would have to restrict my power to 10W... go figure.

Under the licence, if I CAN use a Advanced licence holders equipment 'under supervision'. But guess what, there is NO reasoning or explanation as to WHY, or what is expected of the Adv licencee. It can't be 'better operating procedure' as there is no difference in procedure between the licence classes. It cant be to reduce TVI, as this would be already present in the Adv holders system and present regardless of whom was operating.

The reasoning behind restricting the power output of a novice licencee I /DO/ understand; to minimise the possibility and impact of interference. However, the exam/syllabus does not follow through with this concept. The licence system 'lives in the past' and the focus is on 'construction' (reflecting the historical 'furthering radio experiments' ethos of UK HAM radio), as opposed to 'operation'. "Health and Safety" of the operator is often held up as a further reason, which again ignores the real world; by this logic I need to be supervised to build a 25W radio, in case I hurt myself, whilst blythely ignoring the fact that if I wished to buy a 1250W PSU and install it in a PC, I need neither licence nor supervision. And if I wished to prod about inside my powered-on PC with a screwdriver, there is nothing to stop me, on paper... :-)

As regards power, OFCOM is not unduly bothered about an M3/6/2E0 operator using 100W. There no mobile detector vans randomly checking. They are concerned with ANY licence holder causing interference, such as to local TV reception, regardless of power output. Obviously,

if one had an OFCOM engineer investigating local TVI one would restrict power output to licence conditions.

And finally, no, I am not the President of the RSGB.

Apologies for the hugely off-topic post, but whilst doing so would be against the terms of the licence, no one is going to get hot and bothered about an Intermediate licencee transmitting on 100W. Assuming that after 30+ years the rig is still operating at peak efficiency...

Please don't give bad advice to ignore the regs that have been developed over many years. Are you the President of RSGB? What's your call?
Dave f4eyk "

"Frankly, I wouldn't worry. No one is going to care much if you are tx'ing on 100w, even on a foundation licence, let alone an intermediate, unless you cause interference locally. And that's from the President of the RSGB."

Joe,

Thanks again. I had caught the error, but thanks for the update just in case. The radio is a TS-820 so no digital display. Seller thought it was broken (hi, hi). I am know waiting for a L15-0002-15 coil. This one is black and melted. Wonder if you might have an idea of why, or something to look for before installing replacement and possibly having same thing happen.

hi to all, since i joined the group and asked my question, i have had a great number of messages from members on the subject question,, infact more than i could possibly answer,, so i will take a short cut and say thank you to all members who have offered me advice. I have not gone onair with the rig yet, iam takeing it to my local club so the guys there can check that everything is working with the rig before i try any of the ideas that you guys have sent me,, if all is in order i hope to be on the air soon,, thanks again and a Happy New year to you all.

cheers, 73.

KC2MRU,

Google is your friend. Look here: http://www.qsl.net/g4wpw/sidekick.html

Based on that diagram put the switch on the bottom of the Turner Super Sidekick into the RELAY position and connect the wires as follows:

mic WHITE to 820 PIN 1 (mic hi)
mic RED to 820 PIN 2 (PTT)
mic BLACK to 820 PIN 3 (PTT ground)
mic SHIELD to 820 PIN 4 PIN 4 (mic lo)

40512. KENWOOD HYBRID USER NET (January 7th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-06 19:35:03 UTC
From: mvgilger
Topic: 40512 Message: 40512

The Saturday's net on 40 meter we had 20 stations checking with good band conditions. Out of those, there was 6 running TS-520(x), 4 running TS-530(x), 5 running TS-820(x), 1 running TS-830S. I was running a TS830. The rest were running non hybrids of one model or another.

The Sunday 20 meter net we had 19 stations checking in under good band conditions. Out of those, there were 4 running TS-520(x), 1 running TS-530(x), 2 running TS-820(x), 2 running TS-830S and 1 running 599 twins. I was running a non hybrid TS-830s. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 20, Sunday's total = 19 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

73's,
Mark, WB0IQK

Mark,

Even with "bad" tubes, you will be able to set the "idle Ip." When you tune-up to full power...however small...what is the plate current? Set meter switch to Ip...and in CW mode...key rig... take reading. Sometimes you can get a rather high reading of the plate current...I have found that the cathode resistors could be out of value(high) as it is from these that the plate current that is indicate on the meter comes from. Ball-park...800+ volts and ABOUT 225-260mA of plate current at 100W output.

Subject: Re: [TS-520_820_530_830] TS-520 - heater ON, then loud "POP!"

Thanks for the reply, Joe.

I'm using a Diamond SX-1000 meter. While not a Bird, I do have reasonable faith in it, even at the 5W full scale setting. I can see a something like 100-200mW or so that peaks and dips when the rig is tuned. It's less than 1W, anyhow...

Further, I can monitor the signal on my TS-2000x. It too shows a transmitted signal that is on frequency, stable, that peaks and dips when tuning up the rig (did that on 20M into a matched antenna). The audio even sounds just fine SSB.

As I recall,when toggling the transmit switch, the HV reads just under 900V (close to that). Idle Ip is set to 60mA per manual. Really, other than the tiny power output, as an operator I would think all is well!

So, in my rather uninformed opinion, it "acts like" the final tubes are bad. I printed off lots of pages last night, from the files section. One of them walks through how to check the tubes with an ohm meter. That is on my to-do list today.

What I clearly don't want to do is swap tubes and hear a loud POP again ;)

I appreciate everybody's help!

>Mark,

>
>Â Your final tubes may have totally failed. Is what ever watt meter you are using is it KNOWN good/accurate? IF as you say it "tunes up ok but only puts out a fraction
>of a watt" do you have good HV AND proper Ip at key down? And YES, the newer resistors are really physically smaller than the "old style." Take a look a modern capacitors!You should always stick with the correct ohm valueÂ AND watt rating when dealing with the resistors in the HV, rectifier, and the final amplifier tube circuit board. They "act" as a fuse...hopefully "popping" and protecting the tubes..and some other stuff. Â Ken Kemski..Â k4eaa.com Â Â has a good section on this.
>One of the main reasons that the cathode resistors fail is due to one or both final amp tubes failing for what ever reason. I suggest that you obtain a known good set of finals and a good driver to keep for testing/diagnostic purposes. I still think you are going to need new final amp tubes.

Joe,

Sorry, I should have been more specific.

It's listed in the main parts list as part number L15-0002-15, Choke coil (low frequency). The number is also silk screened on the coil itself. It is mounted directly to the chassis, top side, behind DG-1 unit (if installed) and ahead of C23 and C24 (topside, left and rear when looking from front of unit). When I searched the number on internet I get references to the TS-520 power supply choke. Just wondering if you have any thoughts on this.

Thanks again,
Scott

The Basic Radio Course 1951 book can be bought in soft copy (.pdf) format from seller Ke3gk on ebay.com for $8.99 USD.

item number 200692897318

The seller sends on CD ROM for nominal postage, or will provide via web download. I bought one today, and had it within minutes. Highly recommended.

I also found a couple of sellers for the ARRL handbook, I bought the 1960 and 1965 (off top of head) copies, from different sellers, both willing to ship internationally.

Hope this helps
Alan

Mark,

The BASIC RADIO COURSE by John T. Frye is about the best, easy to
understand, book on basic and intro to advanced electronics I have
found. It's written in easy to understand text.

Mark,

No problem. I know what you speak of. I do not have much expertise regarding this choke. I'll take a look at my schematic. Maybe Mike...w5rkl....can lend a hand
  with this one...he and others have more knowledge on this than I. I can say, that it is part of the 5 volt stable power supply for the "digital display" & I think also for the "counter assembly unit" I can not say why it may be discolored...unless there was a DG-1 installed at one time...and this failed. I have seen a non "S" model have the DG-1 installed by owner/shop post production...Is this possible?

Subject: [TS-520_820_530_830] Re: ts-820 if board question

Joe,

Sorry, I should have been more specific.

It's listed in the main parts list as part number L15-0002-15, Choke coil (low frequency). The number is also silk screened on the coil itself. It is mounted directly to the chassis, top side, behind DG-1 unit (if installed) and ahead of C23 and C24 (topside, left and rear when looking from front of unit). When I searched the number on internet I get references to the TS-520 power supply choke. Just wondering if you have any thoughts on this.

Thanks again,
Scott

I am know waiting for a L15-0002-15 coil. This one is black and melted. Wonder if you might have an idea of why, or something to look for before installing replacement and possibly having same thing happen.

It will probably "work", but what advantage will it give you? The 820s already has a YK-88s filter installed!

Have you read the manual yet?

Hello Ray,

Regardless of what some people say or think, you do NOT need a set of "matched" 6146Bs for your hybrid. The finals are connected in PARALLEL, not push-pull. Just be certain to install the same version of the 6146 in BOTH final sockets. That is, do NOT mix 6146A with 6146B with 6146W versions at the same time!

I have found a small difference between RCA, ECG-Philips, and Matsushita (original 2001 version of 6146B) brands during neutralization. That difference has caused me no problems up to the present.

I bought my 6146B tubes online from various sellers on eBay for less than $20.00 per pair, delivered. All operate fine with no "light show" of any kind. Power out is conservative at 90-115 watts, depending upon the band and tube set I have in at the time. So far, the original Matsushitas have the best power out, but that difference is NOT significant.

73,
Mike wb6csh

40524. RE: [TS-520_820_530_830] TS830 with no output on 10m

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-07 08:12:31 UTC
From: fpath fpath
Topic: 40439 Message: 40524

G'day,

Trouble shooting the 830s with no output on 10m

After having done all the basic checks of relay tapping, bandswitch wiggling, molex connector wiggling is measuring RF drive levels.
When the radio has low or now RF power, it should be standard practice to run TX Level Diagram. If you do not have approx 48 rf volts at the control grids of the 6146 finals it makes no difference what is connected to the other side of the plate blocking capacitor. S22 and padder caps can be in perfect condition and will have no RF output if there is no RF drive at 6146 control grids

The more important parameter is a minimum VCO RF level of approx 1.0 rf volts. VCO is the LO signal applied along with the TIF signal to Transmit Mixer to produce the Transmit output RF drive signal. Measure TP-4 with a standard RF probe and VTVM and see if you have approx 3.0 RF volts of transmit drive. If you do, then you know VCO signal level is adequate on 10 meters. No need to lift any leads?

As Mike suggested you need to measure VCO signal level at TP-3 on RF board.

At this stage I would reland leads and measure VCO signal level at TP-3 to ensure there is 1.0 rf volts as Mike directed. I suspect it is fine. Use a RF Probe (must have 3 diodes) or O-scope and measure RF drive at 6146 finals control grids. 48 rms volts = 48 x 2.82 = 135 rf volts peak to peak on scope. Caution: You cannot use a standard single germanium diode Rf probe to measure Plate of Driver tube or grids of finals. Voltage level will burn out his diode!

If you have good drive at finals control grids (which is doubtful then you have no ALC indication) then we will start looking at S22, padder capacitors and other PA components.

Hopefully this will help

Mike refers to the BASIC RADIO COURSE book. You can get it for free to look at/study by getting your library to do a out of the library system loan from another library system. Granted you won"t get to keep the book forever but will beat the high prices I saw on Amazon this morning. I use this way of looking at books that are not available in our library system with great success all the time. Hope this will be of help. John K5IRK

40526. Manual Typo

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-07 14:22:33 UTC
From: roberteleazer@rocketmail.com
Topic: 40526 Message: 40526

I have been working on a TS-520 that has some serious power supply problems - as in smoke coming from the rectifier unit board. I am replacing the entire rectifier unit board including new caps and some nerw resistors, all of the resistors and caps on the HV board, and all of the power supply capacitors on the chassis

In this process I became aware of a significant typo in the TS-520 Service Manual. Two of the less obvious caps are C27 and C28, which are in a back bottom corner of the chassis and are entirely enclosed by other boards. They are two section 22uf caps that are described in the parts list as "45WV."

But examination of the schematic reveals that those caps are actually 450V caps, not 45V!

Good Luck!

Robert

John,

I wasn't aware of this. It sounds like an excellent avenue to look for books not held at a local library.

The last used hard copy Amazon had showed a price of $4.99 being sold by "saveontextbooks1". I just checked it again and it's still available at Amazon.com.

http://www.amazon.com/gp/offer-listing/B001KUOQOU/ref=dp_olp_used/175-5516546-9988234?ie=UTF8&condition=used

I also recommend those who plan on servicing their hybrids to obtain some test equipment. Quite often hams only have a DVM and while a DVM will work to measure voltages and resistance, it won't work very well when performing alignment. A few suggestions on test gear are:

/*VTVM *//*s*/
Heathkt IM-11, IM-18, Knightkit 232 will work well for servicing the hybrids and other gear.

For portable work, where power is not available, I use the Heathkit IM-17 solid state VTVM. The IM-17 requires 2 batteries, a 1.5VDC battery for measuring resistance and a 8.4VDC battery for the rest of the meter circuitry. The 8.4VDC battery I use is the /*Duracell PROCELL DA146G*/ 8.4 volt battery. They are currently available on eBay under #290759131468 for $1.49 (Buy it now) plus $1.69 shipping (new) or at various other websites. I bought 2 of them. As long as the seal container is not broken the battery has a long shelf life. I don't recommend using a 9 volt battery unless the "measured" battery voltage is less than 9 volts or equal to 8.4 volt. I have no affiliation with the eBay seller's ad (#290759131468) mentioned above. It's only mentioned as a source for the 8.4 volt battery.

/*VTVM probes
*/If the probes not included with the VTVM, they can be constructed rather easily and that includes the RF Probe.

/*AC VTVM*/
Heathkit AV2, AV3 (the AV3 is basically the same as the AV2 except for cosmetics), IM-21 is another AC meter that's similar to the AV2 and AV3.

/*Frequency Counter */
Heathkit IM-4100 (up to 30Mhz), IM-2410 (10Hz to 225Mhz, Sinometer VC-2000 (2 separate input sockets, one from 10Hz to 50Mhz and the other from 50mhz to 2.4Ghz) are good choices. I use both, IM-4100 and Sinometer VC-2000. The Sinometer is also sold under "Victor VC-2000".

The "Victor" name is the exact same counter as the "Sinometer". The VC-2000 has a crystal testing feature the others don't have. The VC-2000 will test and display the frequency of "Fundamental" frequency crystals. Fundamental crystals are typically crystals with a frequency of 20Mhz or less. Overtone crystals can be tested but the counter will only display the "Fundmental" frequency of the crystal. There are some DDS counter kits, especially those that come from China, that may appear to be okay but many, not all of them, have a low maximum input signal level.

/*Oscilloscope*/
E&L INSTRUMENTS is a dual trace scope for monitoring signals at 20Mhz or less. I use mine quite a bit. If you want a 50Mhz dual trace scope then the price will be significantly higher. There are other scopes that are available for cheap prices but you should pay attention to the condition. A scope that's USED and the seller says it powers up okay, may not work properly. Unless you know for sure whether the scope is working properly, not just that it powers up, I would not recommend buying a used scope. Scope probes quite often do not come with used scopes but they can be found on eBay and other website depending on the quality of the probe. Don't buy cheap $10 scope probes, they typically don't last very long. The $10 probe will work but quite often I have found the probe's body construction is cheap and falls apart quickly. I recently replaced both of the $10 probes with higher quality probes, so be careful when buying probes.

/*Signal Generator*/
Heathkit IG-8 and the IG-102 both work well at lower HF frequency but I recommend a frequency counter be connected in parallel with the generator's output to keep the generator on frequency. The Heathkit IG-42 is the "Laboratory" version which may be okay, I haven't owned or use one so I can't comment on it. The military AN/URM-25 is an excellent generator but those in very good to excellent condition can be expensive. I bought mine from Fair Radio Sales in Lima Ohio. I think I paid $135 for it plus shipping. The URM-25 is big and heavy so shipping cost will be expensive. I recommend a frequency counter be used in parallel with the output to ensure the counter's on frequency. The URM-25 was in use by the Navy when I first joined back in April of 1967 so it's an old signal generator. It does not have a sweep feature. If your servicing requires a sweep generator then the URM-25 and Heathkit generators mentioned here are not for you, they don't sweep. You can "manually" sweep the frequency using these generators.

There are some inexpensive DDS generators, some contain the "sweep" feature, being sold on eBay by sellers from China. I have a few non-sweep versions here I purchased just to evaluate them. Most of them operate on voltages between 9VDC and 12VDC. Most have digital displays and some even have an input to allow the generator to function as a frequency counter. Their prices vary quite a bit and if the seller is from China it could take as much as 3 weeks to a month or more to get the item.

/*Function Generator*/
They are similar to an RF signal generator mentioned above but include different output wave forms such as Sine, Square, and Saw Tooth wave forms. Many have a frequency upper limit between 4 and 5Mhz. Some may have a digital display but if the one you are considering doesn't have a digital display, I recommend a frequency counter be connected in parallel with the output so you set the generator to the correct frequency. The Function Generator is a good item to have when troubleshooting "audio" circuits.

Sorry for being long but thought I would provide some suggestions on test gear hams may consider obtaining in order to service their hybrids and other ham gear. Whether you purchase or use any of the suggestions above is entirely up to you. Yes there are higher quality, more expensive, items you can buy. Again, it's entirely up to you what brand and price you are willing to pay for test gear.

You don't need "MATCHED", indicating same emission curent test results etc.
All a parallel tube circuit needs is the same letter suffix and tubes that work.

Ray,

What makes you think you need "matched pair of finals?" Were you told by
someone you should use matched tubes or did you read it somewhere?

40533. Apparently Fixed! Re: [TS-520_820_530_830] TS-520 - heater ON, then loud "POP!"

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-07 23:13:42 UTC
From: Mark L. Hammond
Topic: 40533 Message: 40533

Okay Joe, you win ;) My SX-1000 power meter was broken!

I decided to look over the rig again. I used the ohm meter testing method (file section) on the two final tubes, and they tested OK on all pins. I noted it mentioned that when warm, there might actually be a short. So, having spare tubes on hand, I decided to change out the driver and the two final tubes. Also cleaned the wafers and pots out with some Deoxit while in there; hadn't done that before.

With the new tubes, I powered the radio up, and went through the tuning. It was indeed showing about 225-230mA of plate current, but the broken power meter was showing only a few milliwatts, as before. I admit I felt defeated and set it aside. Did some more reading. Thought again about you mentioning the possibility of a bad power meter. Hooked up my TS-2000X, and it showed the same low power on the SX-1000! I know better, since it has a built in PWR/SWR of course. So much for the HF side of the SX-1000. Have to check the upper bands too...bleh. That's a $200 meter that had been serving me well.

Today I went to Rat Shack and bought their SWR/Power meter. The TS-520 shows a bit over 100W on the 200W meter range (under 100W on the 2kW range, but close enough!!). Next step was to neutralize the new tubes. Fortunately I had a capacitor tuning tool, so that helped. I used my TS-2000X as the receiver to adjust for minimum signal, as per the Kenwood manual (SG switch DOWN). I was able to see the signal drop and then come back up (small adjustments at a time). Left at lowest spot, best I could detect with this method.

Nice to know it's actually OK. One of these days, I'll get curious and put the old tubes back in, but for now, it has a "new old stock" pair of 6146W finals and a new old stock GE driver tube.

I know I read somewhere about "breaking in" new tubes, but I can't put my eyes on it. I'll dig harder in the files section. That info was very helpful.

Hope to try some on the air tests tonight with a local bud.

Thanks for all for the suggestions and help. It was very beneficial!

Set meter switch to Ip...and in CW mode...key rig... take reading. Sometimes you can get a rather high reading of the plate current...I have found that the cathode resistors could be out of value(high) as it is from these

that the plate current that is indicate on the meter comes from. Ball-park...800+ volts and ABOUT 225-260mA of plate current at 100W output.

Did you consider fixing your power meter? There's not much in them, a
couple of diodes and some trimpots. It should be an easy fix.

Hi Lou,

Indeed, that's on my to-do list now. I needed another SWR regardless. The SX-1000 is a $200US meter, so indeed I'm hoping to fix it!

Mark,

Glad I could help you out. I have gotten much help from other members over the past few years...trying now to return the favor.
I am far from an expert here...but sometimes...it takes another person to sometimes point out the obvious...try me on that one!
Enjoy your newly operating rig.

Mike, good morning, thanks for the reply and the additional information. It should be helpful to a bunch of folks trying to get their feet wet on test gear. Have a good week, 73, John K5IRK

I have replaced Q8 and D8 but have not solved the problem. The Tx relay still will not function and instead on key up R13 and R16 started to smoke where there was no previous visual evidence of those resistors being under stress. Guess I've partly dealt with the symptoms but not the cause.. any ideas welcome.
Cheers
Grant

40539. Headset for 830S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-08 20:54:31 UTC
From: rkersey tds.net
Topic: 40539 Message: 40539

Hello All,

Does anyone have a recommendation for a headset with mic
that I would use with the TS-830S? I assume if I set the radio
to Vox I wouldn't need to wire up a PTT switch, but how do I
wire up the headset (earphones) and mic on one of these?
I'm figuring a headset will work better with my hearing aides
than the speaker. Come to think of it, the mic would be nice
and convenient, but optional, as I have a Shure mic.

TIA & 73,
Roy

Hi Ray,

I got several sets from this seller,
new old stock military JAN GE Tubes
6146W $22 ea or the more expensive 6146B $47.50 ea
and the 12BY7A driver tube $10 ea.

I have a VOX board (X54-0001-00) for the 520...
Would sell it for $15 plus $2.00 to mail...

Bob
thanks for your offer which I will keep in mind (I would give you much more than $2 for postage to ZL). I am a little worried that the fault may not be on the VOX board at all so I hope to find the cause before deciding on replacing the board. If anyone has any ideas I would be pleased to hear from you. I have tried following the circuit diagram in the hope of pinpointing some areas to check but until I can get it printed out large scale its too difficult for these eyes scrolling around a PC screen!
73 Grant

The Tx relay still will not function and instead on key up R13 and R16 started to smoke where there was no previous visual evidence of those resistors being under stress. Guess I've partly dealt with the symptoms but not the cause.. any ideas welcome.

Thanks for posting that source! They state the 6146W can replace the 6146, 6146 A and B. Is this true? I use different equipment that uses the different versions of the 6146.

Thanks

Wow, you have listed virtually my entire electronics lab inventory except I have a TEK 465B oscope instead of the E&L.
I must have gotten it right by accident.

Very similar to mine also.

My scopes are a Heath IO-4235(35MHz) and a IO-4550(10MHz) as backup.

For design work I also have a Heath Q-Meter and RLC bridge.

Heath C-3 capacitor tester and IT-28 capacitor tester.

Plus a lot of other seldom used pieces of test gear but nice to have when you need it.

What I need is a low cost microvolt meter. I may be forced to make my own. The HPs are out of my budget.

40546. TS830S: Overheating

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-10 13:36:58 UTC
From: ravnpeter@ymail.com
Topic: 40546 Message: 40546

Recently I acquired two TS830S, so if one fails, the other will take over. On one of them (A) I have a problem with overheating of the finals. After five minutes of transmitting the top cover turns hot, while the temperature hardly rises on the other (B) after long time of operation. The idle current on both radios is 50 mA. On tune the meter on A shows 220 mA and 770 HV, and my outputmeter indicates 100 W.
On tune on B the meter shows 200 mA and 710 HV and the output is 95 W output. On SSB the HV is about 810 HV on both radios. If A isn't keyed and remains in RX psotition, there is no heating. The 220 - 240 V switch on the rear is in the same position on both radios.

Thanks.
Peter, OZ8CTH

Hi,

I am not sure about the 6146A, here is the tube specs

http://www.nj7p.info/Common/Tube/SQL/Tube_query.php?Type=6146w

http://www.nj7p.info/ has large number of tube specs on file

Don't want to be a wise guy, be sure to follow the
neutralization steps when you replace the final tubes.

The files section is a wealth of information. There's a great document on the origins and differences between 6146's. Anyone who reads that should have a much better understanding of these tubes.

Also, there are service manuals, trouble shooting tips, microphone connection details, filter information and lots more. Time and time again I see the same questions come up and mostly it's already there in the files section. Many people have spent time and effort adding to the files section. Using the files section is a good way to thank those benefactors.

It is my understanding that the 6146W can replace the 6146B, but not the 6146A.

I tried a pair of Taylor 6146B tubes in my 830S, and they were just awful. When I contacted RF parts who sold them to me, the fellow I talked to suggested I try a pair of Phillips 6146W tubes which worked very well. They are putting out a solid 100W into a dummy load while only drawing 230 ma. This was measured on my Bird wattmeter. I am more than satisfied with them.

Wasn't going to get into this discussion, 30 years ago I had one faulty tube, I could only get 1x tube within VK5 at the time, it was the s2001, I've put this in and neutralize the pa, to this day (touch wood) it has been working perfectly. I know lots of people say dont do this . The original tube only had 45 minutes of power and was the glass envelope that had a fault, got the new one under warranty. I've had a number of different tubes for rebuilds over the years, I prefer and pay a little extra for RCA and GE tubes, they have only failed when the radio goes to the owner who over drives or over tunes the PA. I have a pair of matched tubes, but only beacuse they came as a spare set when I bought another radio. I put all my spare tubes on a "getter" every 3 months. Dont waste your money on matched pairs unless there the same price.

If you have the mc 50 microphone, minus the base, can It be used on a radio. I know there is a special connection at the rear of the handle. Is the high /low impeadence option in the microphone portion or in the base. Thanks

Brian,

The impedance selection is made in the mic, not the base. The tough part is finding that 5 pin connector. I would like to get a couple/few. If you do not have the manual/schematic I can e-mail it to you.

Just an update on my VOX board issue -
I have now replaced Q8 with an NTE290A, D8 with a 1N4148, and also replaced the overheated resistors R13 and R16 and the board is now fully serviceable. Thanks to those who helped me both on forum and by PM.
Cheers
Grant

Hi all,
I'm just finishing up a 530S today, and it is of note, because it has the most output power I have seen. It has not been QRO modded, that I can see, and puts out 126 watts on 14M and 113 on 10M, at 215-225ma. SG voltage is right on spec, and I checked all the Ip sense resistors that feed the meter. I am measuring power on my HP 8924C test set with the 60W input mod, with a padded dummy load. I use this on all my radios, and usually get exactly the numbers you expect, so I trust it. HV readings are normal also.

This radio came to me with a broken b/sw coupler, broken in half, where the guy had tuned (tried) up with the cage on the wrong band. 5 different resistors were burned up, from the ALC circuit to the SG feed resistor on the rect board. After it was all fixed and I tuned up and got 126w on 14M, I really looked for some QRO mod, but could find nothing.

This is only the 2nd 530S I have worked on. Do they put out a little more? I don't remember that.

It is slightly different in the feel of the tune up. The Ip plate dip is very sharp, and after having tuned up in the tune position (which is high also 22-27w) I have to turn the Load control down, as where it has been set from Tune, will want to give a plate Ip of 250-280ma.

It has the original cage coupling cap, and what looks to be the original bypass cap and L1. I normally change these out, but in this case I will leave well enough alone.

I plan on telling the customer to run at 105-110ma max, but is that really necessary? Could it be that much more efficient?

Am I missing something?

Jim,

I have 2x 530s on my bench, my original is similar to the one your working on, except that 40m, 80 and 160m gives me 120w. Cant say the same for my 3x 830s they all do what they are suppose to do. I know that the 830 I had padder cap issue with, when I first put a normal cap in its place as it started to burn up and go out of spec the output went sky high until the cap finished burning. Have a look on the RF board, R37, I have seen this supersized to 10w before, same set had a 2 black wires cut that run from the front of the RF board over towards the VFO and under the counter board, but still on the RF board. Just a thought as this particluar 530 never had the QRO mod either.

Hi Jim,

I don't have a 530S; I have a 520S, but I think they're output sections are quite similar. The most I'd ever got out of my 530S was right at 100w. It may output more, but I haven't really messed with it.

That yer get'n 126w max output may not be too unusual. What got my attention tho, was the sharp plate dip you mentioned. Could it be going into oscillation? Something you may want to check.

Also, what kind of 6146's are in yer radio? They *should* be B's. Using other types other than the B's are not recommended and can result in instabilities.

Here's a guy that is get'n 110w on 14 Mhz on his 530S...

http://www.youtube.com/watch?v=Ml06oMw_iYo

One review mentioned that the radio can be tuned up to 130 watts or even a little higher, but it's not recommended due to shortened tube life...

http://voices.yahoo.com/review-kenwood-ts-530-ham-radio-6597620.html

Hope this helps,

HI Bob,
Well, I do know that parts in the cage make a difference. Since we found and started using the ceramic doorknob .001 @10kv cap as the final coupling cap, we are getting 10-15 watts more output with no other changes. So it is possible to get more efficient. This cap changes the characteristics of the tune up on the lower bands just a little, but otherwise is just the same tune up. We are getting 110-115w pretty regularly now, but still I have not seen a single one produce over 100w on 10M til this 530S today.

The tubes on this 530S are 6146B's, GE I think, but don't remember for sure. After thinking about it, I think it should be fine, and the tubes should even last longer, if this truly is an efficiency issue, and not some metering problem or something that only had to do with the 530's. If efficiency is increased, then, by definition, less power is being dissipated at the plate and in the tube. So it would run cooler. The very sharp dip would seem to indicate a Hi Q tank circuit, which should produce more power and less loss. Also it may have to be retuned with very little freq change.

I wonder if it could be something like the big coil being wound from a different alloy or something. The caps should be pretty much the same, but lowering the R on the coil might make a difference.

Dave, I checked R38 and it looked fine. I've run it enough now, with tune up and checkout on each band, that I think if there was something unstable, it would have showed up. I'll test it one more time, but am pretty much ready to send it back to the customer.

Hi Jim,

I just received from you one of these doorknobs for the final cage for my TS-520. Can you please elaborate what you mean when you say "This cap changes the characteristics of the tune up on the lower bands just a little"?

Oh, another thought--I also bought a set of the rubber feet for the "side" of the radio. They are very nice and a good bit bigger than the ones on my rig. In fact, they are so tall the existing screws won't thread in. Any idea what the thread is so I can try to find longer ones locally? Maybe the ones on my rig aren't typical "stock" rubber feet.

Thanks for making replacement parts available!

I know lots of people say dont do this . The original tube only had 45 minutes of power and was the glass envelope that had a fault, got the new one under warranty. I've had a number of different tubes for rebuilds over the years, I prefer and pay a little extra for RCA and GE tubes, they have only failed when the radio goes to the owner who over drives or over tunes the PA. I have a pair of matched tubes, but only beacuse they came as a spare set when I bought another radio. I put all my spare tubes on a "getter" every 3 months. Dont waste your money on matched pairs unless there the same price.

40564. 530S / Signal Link Issues

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-12 03:07:18 UTC

Topic: 40504 Message: 40564

I am hoping somebody has already gone through this exercise-

I added a 5 pin DIN connector to the back of the radio in one of the empty connector locations so I could connect the radio to a SignalLink USB interface.

I was thinking the high side of the AF Gain pot would be a good point for constant level RX, but it didn't work out that way. First, the signal appears to get loaded down as you can hear a change in the speaker volume when you connect this signal to the RX input of the SignalLink. And second, when I connect the SignalLink to my PC through the USB cable, I can hear AC hum on the RX audio. If you disconnect the USB cable, the hum goes away.

I can live with the reduction in audio level as this was somewhat expected as the transformer adds additional load. I was able to mitigate this somewhat by adding some additional resistance in series with the input of the transformer. The hum, however, is not acceptable.

The SignalLink uses transformers to couple the input and output audio as well as isolates the radio ground from the computer ground. I verified this by tracing out the circuitry on the SignalLink and verifying with a meter that the grounds are not common.

So, at this point I am not sure how the hum is being coupled onto the audio. Maybe the PCs chassis ground needs to be tied to chassis ground of the radio?

Hi Jim,

The 530 is notrious for a hum in rx, some are worse than others. I spent too much time trying to reduce or eliminate but to no avail
it is a flaw in the circuit, several of the group who have outstanding knowledge gave me lots of help but it didnt go away, it was worse when using headphones. Do the standard check of molex connectors, cracked joints etc. You might be able to improve but will be time consuming checking caps and replacing if you find faulty ones. You might want to use top quality shielded cable, I know this does help along with making sure your ground it good, have you tried bonding everything together? Try re-seating the mounting screws or you can even add star washers to the mounting points, some have been able to improve their hum.

Hi Mark,

I think I can answer this one too. The ceramic doorknob cap are far better than the disk-type caps in the radio. I've used 'em in broadcast trannys as well -- they're small and work superb... really a hi performance cap.

The fact that the tuning characteristics change on low bands (i.e. 160m), is that the capacative reactance is a bit higher at lower freqs...that's all it means. Putting 2 .001's in parallel would technically be less reactive and may negate this effect, but it's really not worth the trouble. The .001's are very common for plate coupling caps.

Jim: Thanks for tell'n me about those 'knobys'... great idea for the 520 and the like. I think I'll upgrade my 520 with one as well.

Bob,
Yes, correct on the low band tuning. It seems to be slightly different on 160M and 80M, Kinda like the Load control won't dip the current, or peak the power at all. It acts like a power level control (kinda like it's spose to?). At first it put me off, but when I realized that everything worked fine, it was OK.

We've tried two of them in parallel, and when you increase the size of the coupling cap, it affects the position of the Load control, and it's kind of like you run out of range for the control, so I don't recommend it. It seems like all the variables that go into making the final tank circuit work are all interrelated and can't just be changed will nilly without having unintended consequences.

And, Mark, maybe we sent you the wrong side feet, I'll send you a set of smaller ones.

40568. Plate current falling

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-12 13:40:17 UTC
From: k5hfg
Topic: 40568 Message: 40568

Good morning all,
I have a 530 and 830 that I replaced screen and cathode resistors, Caps and choke in final tank, cleaned all switches and aligned per manuals. They were both non transmitting when I received them several months ago but up untill a few days ago I had both operating without any problems. I have used them just about every day on SSB and CW on 80, 40, 20 and 17 meters. I have noticed after an hour on the air that the plate current which I constantly monitor begins to fall back on keydown. It is a constant fall back for 50 mA and maybe would fall back more but I do not want to keydown more than a second or so. I can not find anything that would be causing this. HV is 850 and drops to about 750 on keydown. No reported audio or signal distortions. Has anyone experienced this problem. I thought it may be a meter problem, but on 2 rigs that have been revived? I also checked the power on a Bird 43 and it shows a fallback on keydown. About 10-20 watts in a second or so.
Any ideas?
73, Don K5HFG

Thanks, Jim. I'll contact you offlist and send a photo of the feet on my rig and the ones you sent. Maybe the ones on my rig aren't stock??

And the info on the doorknob cap will be helpful, too, when I get the new part installed.

73,

Mark N8MH

I find no humor in someone wishing to have a matched pair of tubes. Seems logical, having a balanced circuit. A matched pair of transistors is best as well, in my opinion.
Everyone will have their own opinion, but I have read plenty of articles written by reputable technicians related to the subject.
It has been said, the stronger tube will prey upon the weaker tube and it will eventually fail. A viscious cycle will repeat, until one uses a matched pair. The same is said about final transistors used in pairs.
The manufacturer of one of my radios which uses transistors as finals, their Lead Technician recommends matched pairs, for that reason.
Yes, matched tubes may cost a little more... To me, well worth it.
Some say, a tube is a tube is a tube... Not all tubes are created equal. I'm sure you've noticed, having to compete with audiophiles in order to obtain some of these tubes. The craving for RCA black plate tubes... GE tubes... Tubes with certain getters...
1,000's of professional musicians cannot be wrong, using tube audio.
If there were something better they'd be using it, I imagine. They too, desire matched tubes. Yes, it even applies to trios, quads, etc, etc in my opinion. I imagine, the equipment manufacturers used matched tubes, tubes manufactured during the same run of production, which should be electrically identical. The equipment peaked and tuned using matched tubes.
There's plenty of talk of using tubes which are not matched... But it usually involves manipulating the electronic circuit, changing the value of components, in order to make the circuit balanced. Compensating for the electrical difference in the tubes... Whether you balance the circuit using matched tubes, or balance the circuit changing components... Most say, balanced is the way to go...
Just my opinions I have formed, having no electronics background, but rather using common sense while reading several articles related to the subject and then coming to my own conclusions...
Feel free to laugh, I can take it.
I am just a radio hobbyist who hopes to have trouble free equipment. I would use a matched pair of tubes. I imagine, if one sends a piece of equipment for repair, the technician would check for a matched pair of tubes, as part of troubleshooting...

Dear herpswre (no call ?)

You missed the whole technical point about parallel vs push-pull circuits.
Tube finals are in Parallel circuits, Both tubes contribute in-phase power to a common point and they add up.
 Audio high fidelity amp pairs are in Push-pull circuits and need to be balanced because they are 180 degrees out of phase and add in a transformer pair of windings or are in a center tapped output xfmr to come out in phase.. Having to be of equal amplitude.
Totally different ideas.

Hi,
I do not agree with you.
One has to consider in what class and in what configuration a pair of output tubes are employed.
In most RF output stages the tubes are run in Class AB1 (FM excepted where Class C is used)
In most Audio output stages the tubes are run in Class A (within the linear curve of the output device, may it be valve or transistor)
In RF output stages the tubes are run in Parrallel (It does not matter if the tubes are matched or not)
If one tube falls of in gain ie no longer matched all one will see is a reduction in output power.
In a Audio output stage most output devices are run in a Push Pull configuration.
If one tube in this output stage looses gain it will result also in loss of power but worse an increase in distortion.
In conclusion then in a pair of parralel wired output devices in a RF output stage Matched or not does not make any difference.
However in a Class A audio output utelizing a push pull configuration it does matter.
Regards Michel vk3kvw

Swith on your internal calibrate signal.
Set the band switch to 10 meters
Peak the signal from the calibrator using the drive control.
If the signal does not peak to S9 you have a problem with the 12BY7 drive tube.

Hello John,

I think you're correct. Also I believe tolerances of the tubes' parameters, such as transconductance, etc. can be quite high thus in audio/push-pull matched pairs are probably a good.
In my TS520SE all I had to do was neutralize them and that was it. Both tubes are different manufactures and have been running fine.

Rick

Michel,
Thanks for the reply. I just checked the TS-530 on 28. It is still as I aligned it back in September. S9. Both rigs tune fine and no reported problems on the other end. But, while I was checking per your suggestion, I tuned back on 17 meters and got a little rough with the load control. In fact I banged it against the stop (by accident not by anger) and the current drop went away and the meter stayed at 100 watts with no drop. I decided to retune and see what happened. My plate dipped deep and every thing tuned up nicely with 220 mA and remained steady. So, it could be as simple as a dirty variable or a cold or cracked solder joint. The problem does act as it would were you to turn the Load control down. Maybe dirty cap? I have no idea how old the finals are but the driver is a new tube I replaced. I am not sure of a better way to clean a variable than to wash it but perhaps someone else has had this experience. I will have to open it back up again and check the drive cap. I do know that the finals were abused by the previous owner,(SK), because the choke was completely blackened and I rewound it. Have not had anything but good results since I worked on it in Sep. until now. I do not remember the load being in bad shape when I inspected it in Sep. It just seems odd that 2 different rigs develop the same glitch at the same time. Oh well, it is something to ponder. 73, Don K5HFG

Don,

Falling Ip after key down is one of the first signs of failing finals. If, as you say, that the previous owner "abused" the rig, especially when the plate choke was discolored indicates that there was/is HIGH heat/current that discolored the varnish on the fine wire that the choke is wound with and,more than likely has damaged the final tubes. I would also suspect that they may be several other components(in the final cage area) that could have also been damaged. Take a look at Ken Kemski"s web site: k4eaa.com he has a very good section dealing with such a problem

Subject: [TS-520_820_530_830] Plate current falling

Good morning all,
I have a 530 and 830 that I replaced screen and cathode resistors, Caps and choke in final tank, cleaned all switches and aligned per manuals. They were both non transmitting when I received them several months ago but up untill a few days ago I had both operating without any problems. I have used them just about every day on SSB and CW on 80, 40, 20 and 17 meters. I have noticed after an hour on the air that the plate current which I constantly monitor begins to fall back on keydown. It is a constant fall back for 50 mA and maybe would fall back more but I do not want to keydown more than a second or so. I can not find anything that would be causing this. HV is 850 and drops to about 750 on keydown. No reported audio or signal distortions. Has anyone experienced this problem. I thought it may be a meter problem, but on 2 rigs that have been revived? I also checked the power on a Bird 43 and it shows a fallback on keydown. About 10-20 watts in a second or so.
Any ideas?
73, Don K5HFG

How does the 12by7a driver tube affect the "calibrate signal," when it is not involved in the receive side of the rig?

Swith on your internal calibrate signal.
Set the band switch to 10 meters
Peak the signal from the calibrator using the drive control.
If the signal does not peak to S9 you have a problem with the 12BY7 drive tube.

Hey Joe,
I believe Michel was thinking of my driver and I checked drive and it is steady. I did say that the rig tunes just fine on all bands with 100 watts and a little less above 17 meters. I replaced all in the final cage as described on Ken's website. I had to rewind the choke because it appeared to be damaged from heat. It looked worse than the piture on Ken's website. It has served fine since September when I did all the repairs. The tubes seem to be fine but like I said in my last post this problem just came up and I did temporarily solve it when I accidently banged the driver on the stop. I think it may be a dirty variable but I will keep an eye on it. I am active almost every day so I can monitor it for the next several days and open it up one day to check the load variable for dirt or loose solder joint or whatever.

Mel,

Very good. I was thinking also that: take a look at the shaft that is connected to the 3 air variables. I have seen the set screws that hold the sprockets in place crack the collars...and get the "system" out of sync if the load control is turned too hard to its stops. These cannot be glued. They are made of nylon...the same goes for the band switch coupler on the 530's and 830's....over time, they will crack...and make life unpleasant.

My TS-520 has both SSB and CW filters. Both work, but when using the CW filter, there is a significant loss in signal strength even when the desired signal is centered at the design frequency of the filter. It is so significant, that I have trouble hearing anything other than the strongest CW stations. I have aligned the rig in accordance with the specs. There are no problems with the SSB function. Is this an indication of a problem with the CW filter or did I perhaps miss something in the alignment process that is causing this problem? Thanks. Tom, W4OEQ

Don,

You have almost answered your own question. You stated that when you banged the control to the stop it corrected the fault, this would usually indicate a loose fitting, cracked\cold solder joint. Kenwood did have a batch of radios where in the the final cage. the wire was only wrapped and not soldered, have a detailed look at all the solder joints and wires that have been wrapped. Unfortunately, as you have stated the former owner did over heat the choke and that you have rewound it, not an easy job and credit to you for rewinding. I'm unsure if you did replace the other common parts in the PA cage from over heating, if you havent I'd replace the parts as per Ken's web page, then at least you know you can eleminate that area altogether. It is not uncommon to have a critter make its home amongst the plates of the air caps, have a good look in between, make sure there is no fine burrs or burn marks. As you fix one radio, I'd then go straight to the other and look in the same area This sounds more like a mechanical issue rather than faulty electronic issue. Please advise what you find.

Subject: [TS-520_820_530_830] Re: Plate current falling

Michel,
Thanks for the reply. I just checked the TS-530 on 28. It is still as I aligned it back in September. S9. Both rigs tune fine and no reported problems on the other end. But, while I was checking per your suggestion, I tuned back on 17 meters and got a little rough with the load control. In fact I banged it against the stop (by accident not by anger) and the current drop went away and the meter stayed at 100 watts with no drop. I decided to retune and see what happened. My plate dipped deep and every thing tuned up nicely with 220 mA and remained steady. So, it could be as simple as a dirty variable or a cold or cracked solder joint. The problem does act as it would were you to turn the Load control down. Maybe dirty cap? I have no idea how old the finals are but the driver is a new tube I replaced. I am not sure of a better way to clean a variable than to wash it but perhaps someone else has had this experience. I will have to open it back up again and check the drive cap. I do know that the finals were abused by the previous owner,(SK), because the choke was completely blackened and I rewound it. Have not had anything but good results since I worked on it in Sep. until now. I do not remember the load being in bad shape when I inspected it in Sep. It just seems odd that 2 different rigs develop the same glitch at the same time. Oh well, it is something to ponder. 73, Don K5HFG

Hello Dave,
Thanks for the reply. I am a follower of K4EAA and have learned quite a bit from his web site. I did replace the plate choke(rewound), C7, C8 and L1 in the tank and I replaced the cathode and screen resistors and realigned per manual this past October when I got the rig at a Ham Fest. Everything checked OK and it has been operating just FB until I noticed this problem. I will update when I know more. I use the rig quite bit so it will not take long to find out. I have also knocked the TS-830 load around a bit and got the same results. I guess it is not that strange to have the same thing happen to 2 different rigs when you consider that we buy them because they need repaired in the first place. No telling what they have been thru before we redeemed them.

Don, Enjoy the radios, nothing nicer knowing that you have done the hard work repairing it. It took me nearly 6 months to fully resotre to radios, both with different problems. If it wasn't for the great folks on this forum then I wouldn't have gotten the passion back to get back into it. I can give you lots my info to check but like to do the simple things first then progress to the harder things, but I'm sure you doing that already. Enjoy and look forward to hearing more of what you find

40584. TS-530-830 plate choke

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-13 03:51:46 UTC
From: k5hfg
Topic: 40584 Message: 40584

All,
I received an Email from Joe inquiring how I replaced a burned plate choke in my 530. I have lost that Email and will attempt to contact Joe thru this post. I removed the burned wire and rubbed the form to remove all the residue and varnish. I measured the wire dia at about .008 and counted the wraps as I removed them. I then rewound the choke using AWG #32 enameled wire. I wound about 10 or 15 turns at a time and secured with elmers glue. I let this dry over nite and repeated the process over many several days. I counted 195 turns so it takes a few days to complete :-)) I buy the wire in 1/4 pound spools. There is over 3,000 ft on the spool. By the way, do not drop the spool on the floor of your shack! It took me a week to untangle and wind it back on another spool.
Only lost a couple feet due to knots but many hours. I am not sure what the inductance of my coil ended up at but it works fine as I can tell. I check it periodically to make sure all is well. I tune my rigs very conservatively and monitor Ip constantly so I know it is not being abused. So far under these conditions I have had no problem with it. I will be sure to mention on this forum if it does not end well. The parts list says it is 470 mH. I am sure mine is within tolerance or it would have caused some trouble by now. It has been 3 1/2 months of almost daily use.

Joe,
You mentioned your wire had come loose from the form. If you are sure it is not broken you can wind it back on and glue it. Otherwise.....hope you have some free time.
73, Don K5HFG

Hi all's.
My Kenwood TS 820 has strange problem.
On 21.200 mhz working like a generator.
On this frequency there is signal for about S3
and wirh VFO-820 connected going to S9.
Well were is peduced this signal without antenna
really i don't know.
I have cecked the major area were i think is generated
but i do not found any thing.
Any one haved same problem.
Thanks
Regards
Emy

Hello fellow hybrid users,

Well today I thought I would get things ready try to check in to the Kenwood hybrid users net for the first time. I heard the folks from the ICOM net and when they turned it over to the Kenwood group but I was not able to hear anyone. Yes this is the first time that I even tried to hear it. Well I guess here in Pittsburg CA. I am not able to hear it. I can hear voices under the noise but not able to understand what is being said. And that's it. Right now I do have a noise floor of s-7 to an s-8. So now going forward ihave the nets in my calendar and will listen again in the future. Hope that there is an opening so that I can check in with my TS-830s.

Cal Vasquez

Subject: [TS-520_820_530_830] KENWOOD HYBRID USER NET (January 7th, update)

The Saturday's net on 40 meter we had 20 stations checking with good band conditions. Out of those, there was 6 running TS-520(x), 4 running TS-530(x), 5 running TS-820(x), 1 running TS-830S. I was running a TS830. The rest were running non hybrids of one model or another.

The Sunday 20 meter net we had 19 stations checking in under good band conditions. Out of those, there were 4 running TS-520(x), 1 running TS-530(x), 2 running TS-820(x), 2 running TS-830S and 1 running 599 twins. I was running a non hybrid TS-830s. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures

will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 - Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 20, Sunday's total = 19 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

My TS520 400 Hz CW filter does reduce the signals, compared to tohe SSB filter, but only about one S unit. Maybe you have a bad filter or alignment problem in the can nearest to the filter input or output.
My newest Kenwood is a TS440s and it does the same thing, about 1 S unit reduction in signals with the 500 Hz CW filter in..

Cal,

There was a slight glitch on the hybrid net; there was no net control so
a few of us kept it going so we wouldn't loose
the frequency for a while, finally, Richard, KJ4ZiZ, took the reigns and
we had a good net with about 20 check ins, net was closed at 20:00 UTM.
You might also want to try checking in Saturday at 12:30pm your time on
40 meters.

Hello All-
I have a basic engineering question that I hope someone may be able to shed some light on. I operate a ts 520s and have long wondered why 1) you can sometimes hear the oscillator whistle on one side of a received SSB signal (or both sides of CW), and why that whistle is often many s-units stronger than the signal itself, and 2) why you can often hear a strong whistle, but no signal.
I'd appreciate both an explanation of why this happens, and also recommendations for further reading on this topic.
Thanks, and Happy New Year to all!
Ned

Thanks for comment. I did further testing and can see the reduction in signal strength of about 1 S units (or perhaps a little more). However, upon closer listening to a steady carrier signal, I see that I do NOT have a single peak on the CW filter. It appears to have two and perhaps three peaks as if the bandpass curve is not symmetrical. If I had a scope, it would show as ripples at the top of the wave plot, I suppose. Would this mean that I have slight differences in the coil settings across the several IF coils? 73, Tom

Hello All-
I have a basic engineering question that I hope someone may be able to shed some light on. I operate a ts 520s and have long wondered why 1) you can sometimes hear the oscillator whistle on one side of a received SSB signal (or both sides of CW), and why that whistle is often many s-units stronger than the signal itself, and 2) why you can often hear a strong whistle, but no signal.
I'd appreciate both an explanation of why this happens, and also recommendations for further reading on this topic.
Thanks, and Happy New Year to all!
Ned

I had arranged that Tom, WB0SGA would be taking
the net today when I heard that Rich took on the duties.

I need to talk Rich into being one of our net
control stations to help out the load.

Thanks for those that checked in and see you this coming weekend.

Most filters have this bandpass "Ripple", caused internally by the filter's structure. I just pick the middle peak and things work ok.

Subject: [TS-520_820_530_830] Re: TS-520 CW Filter Loss of Gain

Thanks for comment. I did further testing and can see the reduction in signal strength of about 1 S units (or perhaps a little more). However, upon closer listening to a steady carrier signal, I see that I do NOT have a single peak on the CW filter. It appears to have two and perhaps three peaks as if the bandpass curve is not symmetrical. If I had a scope, it would show as ripples at the top of the wave plot, I suppose. Would this mean that I have slight differences in the coil settings across the several IF coils? 73, Tom

The transmitter "drive" variable cap is ganged physically to the RF recieve amp tuning cap.
The 12by7 tube would be suspect in fading power output and not really connected to the reciever.
Alignment issues May cause peak redaing ot RX and driver tuning to be in different positions of the "drive" tuning knob..
SO if you peak the reciever signal with the drive and have to move the control to get peak ALC on transmit tuneup You should consider a complete realignment to get things lined up .

I use my 520s on cw quite a bit. The cw filter can reduce a weak signal considerably. Strong signals not affected much at all. If you are a cw op, you really need to do the modification that allows you to cut the cw filter off. You really need the filter at times. most of the time I don't use the filter.
The cw filter will cut out a station responding to a cq all together.

The mod is very easy. All it requires is a couple of pieces of wire. I wired mine to the fixed channel switch. No filter is no. 1, no 2. is the filter in line.

Thanks for the reply - to clarify, I'm interested in understanding the technical reason why you sometimes hear oscillator whistle along with a received signal, sometimes don't, and sometimes hear a received signal with no oscillator noise, on AM, SSB and CW modes.

Well, Ned, I personally still am not sure what you are asking about but let me provide some general info.

Of course, if you tune in an AM signal on a TS-520, whether in CW or SSB modes, you will likely hear the carrier signal in addition to the modulation. In fact, I have on occasion tuned in an AM signal on the ham bands and not even realized it was AM rather than SSB. One guy running an old military transmitter on AM even said that happens to him a great deal; people he is talking to do not even know he is not on SSB. And of course this same thing happens when you tune in an AM signal with a receiver that has a BFO you can turn on and off

Also, it is possible that you might tune in a "beat" note between two AM signals as they interfere with one another, even with am AM-only receiver. Back in the days when all communication was AM with no sideband or carrier suppression that used to happen all the time on the ham bands. They called it "heterodyning." Essentially the carriers of two AM signals are combining so to produce the beat note the same way a BFO does. You still hear this occasionally on aircraft VHF AM transmissions

Here is a simple experiment you can try. Take a little AM portable radio and turn it on. Then turn on your car radio and tune it to a station around the middle of the AM band. Then tune the portable radio, hold it next to the car antenna, and you will find a spot where the local oscillator of the portable interferes with the station you have tuned to, producing a squeal. That's actually a simple way to add a BFO to an AM radio ☐ rather than injecting a signal at the IF inject one at the antenna with another tunable oscillator. In fact hams sued to employ this principle to make sure they were on the same frequency as a station they wanted to communicate with: use the oscillator signal from your separate transmitter to act as a BFO for your receiver, so both are then netted to the same frequency as the other station.

As for "oscillator whine" not accompanied by a station, there are many sources of HF signals that you can receive. One common one is the 3.579 MHZ signal used as a frequency standard by older CRT type TV sets as well as some other equipment. Harmonics of that signal are common as well; I cannot tune in the Kenwood Hybrids Net on Sundays because I get so much interference from TVs on that same frequency that it is just too painful to listen to.

So, I hope I have answered your question, but I am not sure I understood it.

Topic: 40580 Message: 40601

I have already done the modification and it works as it should. I have found that if I begin a CW QSO with the filter off, it is almost impossible to engage the filter and find the other station within the allowable (narrow) passband. I can use the RIT function and try to find the other station but if he is really weak, I may not find him at all. On the other hand, if I answer a station calling CQ and if I previously have tuned him in with the narrow filter, there is no problem in completing the QSO.

I am stating the obvious, but the difference in sensitivity, selectivity, and operator convenience between the 520 and my Omni-VII is tremendous. Technology has come a longgggg way. 72, Tom, W4OEQ

I have done some research with the assistance of another member of this group. The 12by7a can affect the "drive" indication that may show on the front
panel markings around the knob, BUT, removal of the 12by7a driver may degrade the "S meter" reading causing the operator to adjust the load control
to obtain the same "S meter reading" it may be only "one or two hours" let's say...started at 11:00 o'clock...now 10:00 o'clock.

A good test of the driver is to basically see if it can supply "full drive" on 10 meters...which from my understanding and, reading/research..is the
first band to indicate that the driver may be "going soft."

Also, I have found that a drive tube, and or final tubes, may test.....insert....good, or a number here...according to my "various models of tubes testers" and not function correctly in the "actual environment."

Due to inflation...that's my 25 cent worth.

Take a look at the HV UNIT X43-1110-00...measure the voltage...at the "wire wrap" posts....I think one post is marked "210" another "TUNE" It is possible that resistors R-5 & R-6, both 56K, have gone way out of spec.Tune mode cuts the voltage down during "tune" to give the finals a break from being operated out of tune..while "tuning." There may be other problems...but measure the voltages first. BE CAREFUL!!!! THERE IS ABOUT 900VDC LURKING AROUND THAT AREA!

The "LOAD" control has absolutely nothing to do with nor will it have
any affect on the receivesignal and the receiver's "S" meter indication
in receive!

The "LOAD" control is a "Transmitter " control and functions ONLY in
transmit. It is a multi-section variable capacitor which is part of and
attached to the output of the final amplifier's PI Network. The LOAD
control, when adjusted, provides a means to match the impedance load
(antenna or dummy load) connected to the antenna connector's SO-239 and
the output of the PI Network.

The receive signal does NOT flow through the PI Network and any
adjustment of the LOAD control will have no affect on the receive signal.

Hi Ned,

I think I understand yer question. Remember that there is a sideband filter in yer radio that will lop off 1 sideband - either the upper or lower depending where you set it. So, when you tune across a carrier, you will only hear 1 'whoop' (how's that for a word?) while spinning the dial over the carrier. Any yes, that whoop (whistle) sound will be pretty loud depending on the carrier level of what you're receiving.

With receiving CW mode, it does not lop off either upper or lower sidebands - it's more like AM where it can receive either sideband, but is usually very narrow bandwidth. So- if you tune across CW signals, you'll hear tone on either side of the dead-center carrier.

How's that?

Bob, KD5MHQ

From: Ned Chatelain nedchatelain@...>

Hello All-

I have a basic engineering question that I hope someone may be able to shed
some light on.

I operate a ts 520s and have long wondered why

1) you can sometimes hear the oscillator whistle on one side of a received SSB signal (or both sides of CW), and why that whistle is often many s-units stronger than the signal itself, and

2) why you can often hear a strong whistle, but no signal.

I'd appreciate both an explanation of why this happens, and also
recommendations for further reading on this topic.
Thanks, and Happy New Year to all!

Hi Bob,

"With receiving CW mode, it does not lop off either upper or lower sidebands - it's more like AM where it can receive either sideband, but is usually very narrow bandwidth. So- if you tune across CW signals, you'll hear tone on either side of the dead-center carrier."

I think we need to be a little bit careful with this. This may depend on the design of the receiver. I'm not familar with Kenwood receivers. I have done a lot of work on the Heathkit SB-104 transceivers. In the SB-104, receive mode for CW selects USB for the receiver. In transmit, a seperate carrier oscillator is used at a frequency slighty shifted from the USB carrier generator.

73,

Bill

Subject: Re: [TS-520_820_530_830] Engineering Question

Hi Ned,

I think I understand yer question. Remember that there is a sideband filter in yer radio that will lop off 1 sideband - either the upper or lower depending where you set it. So, when you tune across a carrier, you will only hear 1 'whoop' (how's that for a word?) while spinning the dial over the carrier. Any yes, that whoop (whistle) sound will be pretty loud depending on the carrier level of what you're receiving.

With receiving CW mode, it does not lop off either upper or lower sidebands - it's more like AM where it can receive either sideband, but is usually very narrow bandwidth. So- if you tune across CW signals, you'll hear tone on either side of the dead-center carrier.

The "LOAD" control has absolutely nothing to do with nor will it have
any affect on the receivesignal and the receiver's "S" meter indication
in receive!

The "LOAD" control is a "Transmitter " control and functions ONLY in
transmit. It is a multi-section variable capacitor which is part of and
attached to the output of the final amplifier's PI Network. The LOAD
control, when adjusted, provides a means to match the impedance load
(antenna or dummy load) connected to the antenna connector's SO-239 and
the output of the PI Network.

The receive signal does NOT flow through the PI Network and any
adjustment of the LOAD control will have no affect on the receive signal.

Hi Bill,

Yes, you're correct, I stand corrected on that. However, it seems that tx favors neither sideband per se; it's more of an offset. Correct me if I said this correctly...maybe I'm not saying it right. As I understand it, there needs to be an offset somewhere, or no tone would be heard, say, if both the rx and tx were spot on center freq....unless a BFO were used. Ok, these are some more rx 'tricks', and then there are product detecters, etc, etc. It's hard to express this all in text form (hi). I got it in my head tho. ;-)

THanks, 73,

Bob, KD5MHQ

Bob - I think your answer was closest to what i was looking for - the thing that still confuses me, however, is why you can hear the carrier at all. I thought that the whole advantage of SSB over AM was the narrower bandwidth required after one sideband and the carrier were suppressed *prior to *transmission.
Why, then, do we still hear the carrier "whoop" (great word...) on LSB or USB? And with CW, why would there be two carrier "whoops?" Is a carrier restored to the modulated signal by the IF in the receiver and then converted to audio? If so, why do we often not hear any "whoops" at all?!?!?!

Robert - thanks for your explanation of the ghost carrier noise. I live in a densely populated suburb where electrical white noise is a terrible problem - it never occurred to me that there could be an appliance transmitting on a narrow enough bandwidth to confuse my receiver into thinking it was a signal....ahhh, modern life. My grandfather used to drive his neighbors nuts by interfering with their TV's while he was operating. Now they are interfering with us!!

In a MODERN reciever with the proper filters and aligned correctly you should only hear a high and desending pitch as you tune across a CW signal and then dissappearing as you tune past it. Retuning in the other direction passing by it should appear suddenly as a low pitch and increase pitch and again disappear as you pass by. We used to call that "single signal reception" .
 a properly operating SSB transmitter should have no audible carrier as you tune it in.

Topic: 40591 Message: 40615

The answer to:

Tone: You have a Beat frequency osc (BFO). It mixes with the cw signal and is usually 600 cps different in frequency to produce the tone that you hear. Without a BFO, a receiver is just an AM receiver. It is also used in SSB as it replaces the carrier that existed with AM.

Offset. The reason that you hear a 600 cps note (in cw mode) is because of the offset. This offset is adjustable, but most rigs are set to 600 cps.

In the days of old, we had to know what a BFO was because it was a control on our receiver. We also had to know what "zero beat" was and how to use it. This is because our TX and RX were separate units and we had to adjust all of the things that are automatic on most radios today.

Additionally (but not related to your question) with Unmatched separates we had to provide the following:::

TX to RX

* Un-key the TX (this is more than the CW key)
* Switch antennas (Dow key)
* UN-mute the RX
* Turn off VFO so as not to cause interference. VFO was another box on the table, not built in.
* Readjust the BFO and/or RX-VFO to his signal that has now drifted.
* Provide for grid block keying

RX-TX

* Switch antenna (Dow key)
* Mute TX audio or at lease reduce RF gain control
* Short antenna input to RX so as not to over drive the front end of receiver.
* Turn on VFO
* Turn on the transmitter
* Provide for grid block keying
* NOW and only NOW operate the CW key (chirp chirp chirp), darn have to buy a new OB2

Yes all of this had to be done on each exchange. Most of us automated (sort of) with a bank of relays contacts. You could hear them snap crackle and pop each time. If you think I am kidding, print this out and take to an "OT" in your club. He will look at is, chuckle, and then nod his head. Be ready for an interesting story. It will be worth your time and he will give you a lot more information to your question.

Ned,

I mean no disrespect but I recommend doing some studying in the ARRL handbook(early to mid 70s edition) on basic AM and CW transmitter and receiver with a BFO so you understand how a simple signal is created and processed. Once you have a solid foundation in that subject then you can move on to the more advance signal processing that takes place in an SSB transmitter, receiver, and transceiver. I wouldn't recommend jumping first into trying to understand SSB without a firm grasp of the basic's in AM and CW transmitter and receiver signal creation and processing.

Greg, I have been using an Autek Research QF-1 audio filter, for a few decades, between the headfone output on my TS520 and TS440s and a variety of speakers.
The latest external speaker is a sturdy, loud and good sounding Kenwood KES-5 speaker for a commercial 2-way radio.
There are a lot of other variable audio peak/notch filters available in kit form for under $100 that do a great job. .
There are also pricey DSP filters that I wonder about, are they any better or just designer baloney :D

Hi
I don't mean to hijack your thread, but I am also looking for a replacement speaker for my TS520. I have the speaker that is for that model, but want something with filters or some stand alone filters that I can use with the original speaker. Any ideas?

40623. Sudden complete loss of rx - TS520S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-16 12:00:10 UTC
From: Guido Luis Perazzoli
Topic: 40623 Message: 40623

Hi folks,

Last saturday I was tuning up my TS520S and suddenly it suffered a total loss of rx.

TX works ok. Full output power. Although, No rx.

I checked the relay (ok), then HET-CAR-VFO signals are working ok. I cannot get signals from TP2 or TP3 on the RF board... but I don't know where to go next. Audio board seems to work.

I would really appreciate all tips regarding this issue.

I to run the QF-1 filter and I use either the SP-820 or the SP-230 depending which radio I am on....I also have unit from the "dark side" (solid state) that I use on a regular basis....It has a fully adjustable DSP.....Actually does an amazing job of cleaning signals up....The other combination with my Hybrid units does a good job....but of course takes a little time to get things set-up just right....Personally it does not stand toe to toe with the adjustable DSP unit.....but very close....and actually with an extreme heterodyne signal on the band it does a better job of filtering it out....."old tech" can be very effective in the hands of the right user.....I have used many "outboard "speakers on various rigs.....and I always end up with the SP-230 if I am looking for quality audio....

Regards....Wes....VA6DWH

Guido:

Tried a reply to your RX problem question with a suggested troubleshooting approach but Yahoo lost it and I am not going to waste any more time on it.

Here is what the TS-520 Service notes say about RX problems:

Low Sensitivity: Touching RLT and 9V at function switch.
Receiver sensitivity: No -6v at AVR: Q8 2SC735 on X43-1100-00 is bad.
Frequency Shift: Bad carreir Xtal 3395 on carrier unit.
VFO drift: C6 22pf, VFO unit.
No receive: Bad Q4, 3rd IF amp 3SK35GR on X48-1060-00.
Receiver sensitivity and bias current jump, -6v unstable: T1 oscillator transformer for -6v is bad on X43-1100-00.
Erratic AGC action: C11 100uf 16Von X431100-00. Fix channel AVR is bad.
Frequency shift when warmed up: Q1 in VFO 3SK22GR.
No RX or TX: If unit C59 touch to T12 IF transformer.
Receiver noise: Q5 3SK35Y X44-1080-00.
Receiver sensitivity down: NBI terminal is pulled loose. Receiver at IF board.
No S meter reading and RF gain CCW. No meter deflection: Q3 on IF unit. Q5 on RF unit.
VFO frequency jumped: There is loose tension inside VFO.
VFO frequency shift: Cold solder of VFO output lead to VFO output socket.
Blows fuse when first on: Check Q1 and Q2 DC-DC converter transistor. One is possibly shorted.
Noise blanker inoperative: R6 4.7K resistor is broken at Q2 on X54- 1080-10.
Loud audio squeal: Q4 3SB473 on X49-0008-01 shorted.
Low receiver sensitivity: Diode D4 1S1587 on RF unit.
VFO intermittant: Wire to L1 in VFO is not soldered.
No receive: Q4 3SK35Y, Q5 3SK35GR on RF unit.
No receive: Q9 3SK35GR on IF unit.
Hash noise in receiver: Q3 on RF unit 3SK41.
Blows fuse: C31 power supply is shorted, 100uf 500v. Also check associated diode D3, D4.
No RX on all bands: WWV switch is broken or a wire is loose or not soldered.
Receiver sensitivity: Q5 on RF amp 3SK35Y.
Receiver sensitivity: NBO terminal on X48-1060-00 is loose.
Low audio: Check for purple wire touch to ground at 12 pin connector in rear panel.

Good luck!

Robert

Good Morning,

I fired up my TS-820S last night and found a clicking noise coming from the radio. What seems to be happening is the relays are going into transmit mode even though I did not switch to that mode. I checked to be sure the VOX was off (it was). I then pulled the mic, but the relays continued to click away. I'd like to ask the group if anyone has encountered this problem and where I can look to fix the issue. Thanks in advance for any help.

If you can run balanced line into the shack I think the MFJ974 balanced line tuner , that I use, is best for this kind of antenna.
The rig it's self can work into just about any unbalanced coax fed antenna without using a tuner since the output PI network handles a wide range of impedances.

Folks, TWICE now in the past two days I have tried to post a reply to a question posted by someone else, only to have it lost when Yahoo then responded that it could not find the original message!

This happened yesterday with my response to Guido on his receive problem and this morning with my response to John on his request for help on an unspecified TS-820S topic.

So, if you do not get a response to a request for help it is very likely that it is because Yahoo is broke and not because no one cares.

So John, try to post you question agin and then look very carefully, since a response will NOT be as an addentum to your original post. That don't work no more.

I use a G5RV Jr antenna, antenna actually does fine on 40, 17, 10 and 6 meters without a tuner according to my antenna analiser. Antenna works fine on other bands as well.
I just tune the 830S for all bands without using an antenna tuner.
I tried using an auto antenna tuner a few years back on my 520SE and it didn't work so I just went to tuning the radio as per Ken's (K4EAA) instructions.

John,

Are both relays "clicking?" There are two...one on the "relay board" and another under the metal shield by the final amp board. Check the voltages on the AF-AVR board first...you can look on Pg 38 of the "operators manual" or Pg 44 of the "service manual."
It is possible that you may have a failure on the "relay board," or the T/R relay by the final board...it's under the metal shield. You may also just want to remove both relays and inspect/clean the contacts, both external and internal. Easy places to start. Do that with the radio off and UNPLUGGED for awhile...you will be very close to 900VDC in a couple of areas...so let the HV caps bleed off.
I have not heard about this problem before. I am far from an expert on these rigs...some diagnostics are currently beyond my skill level...but I will help as much as I can.

Hans,

Try disconnecting antenna or turning antenna switch to unused or ground postion after turning radio off. Then next time you go to use radio, turn radio on then connect antenna, on my 5 hybrid radios all do the same as what your experiencing. This is the way I do it and haven't had an issue since.

Glad I could help you getting it back working. Those resistors are the first place to look if you have the "no alc in tune" problem. It is not specific to the 520.
The 820, 530, 830 can also suffer from it..resistors are just numbered differently and are in different places.

Rob,

You might look around for an AT-180 on QRZ or E-Pay... The one you want is the "real" KENWOOD AT-180, not the one with the same model number, from "another" manufacturer. ;) AT-200 would also work well, from my experience. (Keep the lights low in the shack, nobody will notice the slight difference in the front panel paint)

Rob,

You might look around for an AT-180 on QRZ or E-Pay... The one you want is the "real" KENWOOD AT-180, not the one with the same model number, from "another" manufacturer. ;) AT-200 would also work well, from my experience. (Keep the lights low in the shack, nobody will notice the slight difference in the front panel paint)

The Kenwood AT-230 is another possibility. The difference between the AT-200 and the AT-230 is the AT-230 also has the WARC bands.

You don't need the WARC bands for an original TS-520 but if you get one of the newer units it might be nice to have them.

40643. Digital Display On My TS-830S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-18 04:59:46 UTC
From: waynemvoigt
Topic: 40643 Message: 40643

Hi Everyone,
I will try to explain my problem. I set the Digital Display to 3.875.0 ok.
It will stay as set and then it will change to read 3.000.0. The VFO stays on Freq. 3.875 but the read out shows 3.000.0. I can sometimes turn the Fix button on then off and it will show the correct Freq. setting 3.875.0. I can continue to transmit on 3.875 even though the read out reads 3.000.0. My Analog Dial Scale is not calibrated right so I cannot depend on it. That is another problem I have to cure. Sure Hope someone can guide me on how to fix my readout. I had some problems last year and Terry jumped in and helped me through them and everything worked out just find. This is Truly a Great Net. Someone always has the answer to someones problem and Via you have the Fix. Thanks for your Help.
Wayne W6WMV Finley,Ca.

Rob,

Contrary to what some hams believe/tell you and what some G5RV sales ads tell you, the 520 and other Kenwood hybrids have a "limited" output impedance matching range. Therefore, for "proper impedance matching" AND for "maximum transfer of power" to the antenna I highly recommend you use a suitable tuner between the transmitter and the G5RV antenna.

There are a variety of manual tuners available that will work with the G5RV antenna. I used a Drake MN-2000 tuners with a 102' long G5RV for years on 80 thru 10 with very good results. The G5RV can be strung between trees in a dipole arrangement or as an inverted vee, it doesn't matter but you should use a tuner for proper impedance matching AND for maximum power transfer to the antenna. Auto tuners can also be used but I prefer manual tuners myself.

I also recommend you obtain, if you do not already have one, a 50 ohm dummy load with a power rating equal to or higher than the maximum RF power your station currently produces. If you plan on purchasing an amplifier at a later date, the dummy load should be able to handle the maximum RF power the amplifier is capable of producing. All transmitter and amplifier tuning should be done with the dummy load connected to the transmitter/amplifier's output FIRST. Once the transmitter/amplifier tuning is complete and the tuner is connected, do NOT touch the transmitter and/or amplifier tuning controls. Make ALL adjustments for lowest SWR and maximum power transfer to the antenna with the "tuner controls".

Mike,

By stating that the hybrids have a "limited" output impedance matching range, do you mean for example that the radios will not effectively match anything higher than a 3:1 SWR?

I just put my G5RV Jr, which is up about 45 ft, on an analiser and got:

80m 2.2 - 2.5: 1
40m 1.8 - 2.7: 1
20m 2.5 - 2.8: 1
17m 1.7 - 2.0: 1
15m 1.0 - 1.6: 1
12m 2.0 : 1
10m 1.2 - 2.1: 1
6m 1.3 - 2.0: 1

I don't see a problem using the radio on its own without a tuner to get a good match using above figures.

Jose,

What I said was

"...Kenwood hybrids have a "limited" output impedance matching range. Therefore, for "proper impedance matching" AND for "maximum transfer of power" to the antenna I highly recommend you use a suitable tuner between the transmitter and the G5RV antenna.

...The G5RV can be strung between trees in a dipole arrangement or as an inverted vee, it doesn't matter but you should use a tuner for proper impedance matching AND for maximum power transfer to the antenna. Auto tuners can also be used but I prefer manual tuners myself."

The final amplifier's PI Network output and receiver's input impedance range of the Kenwood hybrids is between 50 and 70 ohms (see the manual's specification page for further details). The impedance range has a slight difference on the top and bottom end of the LOAD controlbut for maximum power transfer and lowest SWR, a tuner is recommendedwith the G5RV.

Having said all that and as always, whether you use a tuner or not is entirely up to you. I can only recommend a course of action to take based onexperience.

I use a G5RV Jr antenna, antenna actually does fine on 40, 17, 10 and 6 meters without a tuner according to my antenna analiser. Antenna works fine on other bands as well.
I just tune the 830S for all bands without using an antenna tuner.
I tried using an auto antenna tuner a few years back on my 520SE and it didn't work so I just went to tuning the radio as per Ken's (K4EAA) instructions.

Hi Jimmy,

I do not use a balun.
Antenna is a Radiowavz G5RV JR we picked up at HRO in New Hampshire a couple of summers ago for $25.00.
It has an 18ft twin lead section with PL 239 connector.
It does help having it up 45 feet. We have a neighbor that has a tree cutting business and I talked him into bringing his cherry picker over to install the antenna.

We also use a GAP Eagle vertical dipole that does not require a tuner for 40, 20, 17, 15, 12 nd 10 meters.

Your setup is similar to mine. I am using a Kenwood TS-530S with a B&W VS300A tuner connected to a Hustler 4-BTV vertical as my primary antenna and a G5RV as the second antenna with a random length wire as the third antenna. This is switched using the built in antenna switch and everything works fine I like the setup and it works for me,

John,

I can't find any reference in the 520 or the 520S operator's manual that states the 520's "output impedance" range is between 15 and 200 ohms. The manual states in the specification page the "output impedance" is "50 to 70" ohms and there are several references in the manual that states the 520 should be connected to a "50 ohm impedance with less than 2:1 SWR".

The G5RV is a very good all band antenna. I used a G5RV fed through a Drake MN-2000 tuner not only with a TS-820 I use to own but also with Drake C Line, Heathkit HW-101, Heathkit SB-100, Heathkit Apache TX1, Heathkit Marauder HX-10, Heathkit SB-400/401, and a Yaesu FT-857D. I no longer have the 820 but I still have and use all the other gear. The Apache TX-1 is down for HV supply capacitor replacement.

Tom Rauch, W8JI, has a webpage devoted to the G5RV with a nice informative write up (see the following link) which he states, as I did, that a tuner is required with a G5RV.

www.w8ji.com/g5rv_facts.htm

However John, and others, whether you use an antenna tuner with a G5RV or not is entirely up you. I personally would not feed an unbalanced "coax fed" G5RV without using a tuner.

Jose,

You said you tried using an auto tuner with your 520SE but it didn't work. What type of antenna were you using with the auto tuner?

It appears from you statement that you might possibly be saying the auto tuner was at fault. If that's true, why do you think the auto tuner was at fault? What model auto tuner were you using?

John and others,

I stand corrected with the help from Terry. I did find the reference to 15-200 ohms impedance range in the manual, section 1.2 Antenna. I obviously missed that when I was searching for it in the manual. Some times it helps to have a second pair of eyes.

Having said that, I personally would not feed a G5RV without a tuner. Whether you do or not is entirely up to you. As I said, I had excellent result with my G5RV. It performed well at all power levels on most ham bands. I used it with my modified 11 meter Johnson Messenger 223 which is now a DDS VFO controlled AM transceiver on 29.0Mhz at 6 watts output. Worked a lot of stations on 10 meter AM when the band was open, all going through the MN-2000 tuner to the G5RV.

John,

I can't find any reference in the 520 or the 520S operator's manual that states the 520's "output impedance" range is between 15 and 200 ohms. The manual states in the specification page the "output impedance" is "50 to 70" ohms and there are several references in the manual that states the 520 should be connected to a "50 ohm impedance with less than 2:1 SWR".

John and others,

An SWR ratio of 2:1, for example, has a power loss of 11%. Therefore, if the transmitter is producing 100 watts output and the antenna system presents an SWR of 2:1 to the transmitter, the effective radated power "at the antenna" is now down to 89 watts, a loss of 11 watts in the antenna system. A higher SWR of say 3:1 has a power loss of 25% and with the same 100 watts output at the transmitter will result in 75 watts of effective radiated power at the antenna, a loss of 25 watts. Let go one step further and take a linear amplifier with a power output at the amplifier's antenna connector of 600 watts and a 3:1 SWR. The power loss is "150 watts" resulting in an effective radiate power at the antenna of 450 watts. As you can see, the higher the SWR ratio is the greater the power loss is and the lower the antenna's efficiency and effective radiate power is. That's why I recommended using a tuner with the G5RV so the antenna's efficiency is as close to maximum and the effective radiated power is as close to maximum as possible. Why allow power loss in your antenna system to occur simply because one doesn't use a tuner to achieve the "lowest SWR" possible and the "maximum transfer of power" (effective radiated power) at the antenna can occur with a tuner?

The following link provides percentages of power loss based on SWR ratios:

http://www.firestik.com/Tech_Docs/SWRLOSS.htm

Here's another link Terry gave me that may be of interest for those members who are using the G5RV. It's a very good webpage that shows you what the G5RV radiation patterns are on various HF ham band frequencies.

http://hf-antenna.com/014/

As the website says, you should consider these radiation patterns when building and using a G5RV antenna.

Hi Joe,

I took your kind advice and checked the voltages on the AF-AVR board and sadly found them to be OK. Next I checked the relays and found that on set of contacts on the relay on the relay board were stuck in the wrong position. I carefully fixed the relay and cleaned all of the contacts and all is now ok the rx side of things. I then reconnected the relays to the Fix-VOX board and sadly, they started to click away again. i started to check voltages on the FIX-VOX board and found the 14A voltage had a 1 volt sawtooth riding on it. Looking back to the relay board this voltage was clean. Unfortunately, my schematic is not real good (small) so I'm having a tough time finding where the junk is coming from. I'm wondering if Q9 on the FIX-VOX board could be bad as it seems to be only partially conducting, but just enough to make the relay chatter. Interestingly, when I disconnect the relays from Q9 voltage goes up to noisy 14 volts. I guessing that would be normal as the is no load on the collector. The manual I have ain't a good one, but it gets me around. I'd love to have one with a bit more detail.
Any thoughts??

Are you referring to feedline loss< depends on type of coax and freq , not just

a flat tax of 11%.
Or is it reflected power of 11 % burning up in the final ?? Some of that ends up going back to the antenna depending on phase, reactance and things that hurt my brain !

Hi All,

Have had a few direct emails relating to Class types, thought it would be good to put some basic information on the forum. Sorry to those who know this, but thought it would help some of the newbies to the Hybird era

1. Class A means that the power tube conducts the same amount of current all the time, whether idling or producing full power. Class A is very inefficient with electricity but usually gives very low distortion.

There are single-ended class-A, or SE, amplifiers. They use one or more tubes in parallel, which are all in phase with each other. This is commonly used in smaller guitar amps and in exotic high-end amplifiers. Many audiophiles prefer the SE amplifier, even though it has relatively high levels of even-order distortion. Most 300B high-end amplifiers are SE. Negative feedback, which can be used to decrease the distortion of an amplifier, is felt by some people to sound inferior. Most SE amps have no feedback.
Push-pull class-A amplifiers also exist--they use two, four or more tubes (always in pairs) which are driven in opposite phase to each other. This cancels out the even-order distortion and gives very clean sound. An example of a class-A push-pull amplifier is the Vox AC-30 guitar amp. Push-pull Class A operation usually involves low plate voltages and high plate currents, compared to Class AB operation below. The high currents might tend to wear out the tube cathodes faster than in an AB amplifier.
There are two kinds of class-A operation, which can apply to single-ended or push-pull.
--Class A1 means that the grid voltage is always more negative than the cathode voltage. This gives the greatest possible linearity and is used with triodes such as the SV300B, and with audio beam tetrodes and pentodes.
--Class A2 means that the grid is driven MORE POSITIVE than the cathode for part or all of the waveform. This means the grid will draw current from the cathode and heat up. A2 is not often used with beam tetrodes, pentodes or triodes like the SV300B, especially in audio. Usually a class-A2 amplifier will use tubes with special rugged grids, such as the SV811 and SV572 series of triodes.
Class A2 also requires a special driver circuit, that can supply power to the grid.
2. Class AB applies only to push-pull amplifiers. It means that when one tube's grid is driven until its plate current cuts off (stops) completely, the other tube takes over and handles the power output. This gives greater efficiency than Class A. It also results in increased distortion, unless the amplifier is carefully designed and uses some negative feedback. There are class-AB1 and class-AB2 amplifiers; the differences are the same as were explained above--the tube's grids are not (AB1) or are (AB2) driven positive.
3. Class B applies only to push-pull amplifiers in audio; it SOMETIMES applies to RF power amplifiers with one tube. It is like Class AB, except that the tubes idle at or near zero current. This gives even greater efficiency than Class A or AB. It also results in increased distortion, unless the amplifier is carefully designed and uses some negative feedback. If careful design is not undertaken, the result may be crossover distortion, which appears at the midpoint of the output waveform and has very bad-sounding effects in audio. Most solid-state audio amplifiers use class B, because the transistors undergo less heat stress when idling.

Bias
Bias is a negative voltage applied to a power tube's control grid, to set the amount of idle current the tube draws. It is important to bias a tube to stay within its rated dissipation. Otherwise, you DO NOT need to worry about small deviances from the manufacturer's recommendations. Many times we have customers asking us things like, "I replaced the tubes, the old tubes ran at 35 mA, the new ones run at 38 mA. I'm worried that I have to rebias the amp." This is NOT worth worrying about. Especially with guitar amps--they tend to run their tubes at idle conditions which are conservative. Some high-end audio amps run their power tubes quite hard--in that case, rebiasing is necessary. Many amps have no bias adjustments at all, and are designed so that you do not need to concern yourself with bias. This includes most Mesa-Boogie guitar amps, most amps using EL84s, and many single-ended triode hi-fi amps

Regards

Dave

The Kenwood AT-230 is another possibility. The difference between the AT-200 and the AT-230 is the AT-230 also has the WARC bands.

You don't need the WARC bands for an original TS-520 but if you get one of the newer units it might be nice to have them.

  Rob,

  You might look around for an AT-180 on QRZ or E-Pay... The one you want is the "real" KENWOOD AT-180, not the one with the same model number, from "another" manufacturer. ;) AT-200 would also work well, from my experience. (Keep the lights low in the shack, nobody will notice the slight difference in the front panel paint)

40668. KENWOOD HYBRID USER NET (January 13th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-20 19:36:53 UTC
From: mvgilger
Topic: 40668 Message: 40668

The Saturday's net on 40 meter we had 19 stations checking with good band conditions. Out of those, there was 3 running TS-520(x), 2 running TS-530(x), 6 running TS-820(x), 4 running TS-830S. I was running a TS830. The rest were running non hybrids of one model or another.

The Sunday 20 meter was run byu Richard, KJ4ZIZ. The had 20 stations checking in. Out of those, there were 3 running TS-520(x), 1 running TS-530(x), 4 running TS-820(x), 4 running TS-830S and 1 running a set of 599 Twins . Richard was running his TS-520. Thanks Richard for stepping up and doing a good job running the net in my absence.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 49, Sunday's total = 39 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

The Saturday's net on 40 meter we had 28 stations checking with good band conditions. Out of those, there was 7 running TS-520(x), 3 running TS-530(x), 7 running TS-820(x), 3 running TS-830S. I was running a TS830. The rest were running non hybrids of one model or another. A last minute check-in was WB8WT and indicated he had two TS-511's and would check in next Saturday using one of them. I will look forward to hearing it.

The Sunday 20 meter net we had 25 stations checking in under. Out of those, there were 6 running TS-520(x), 0 running TS-530(x), 5 running TS-820(x), 3 running TS-830S . I was running a non hybrid TS-940. The rest were running non hybrids of one model or another. Richard, KJ4ZIZ picked up the net last Sunday, and did a good job.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

Topic: 6768 Message: 40670

There have been a lot of replies to this thread, so I will be brief. I use either an LDG auto tuner or a MFJ manual tuner (Versa Tuner II) with my hybrids. I have several antennas, including a G5RV-Jr with 16 feet of ladder line, and with the G5RV-Jr I find the tuner is really needed on several bands to get the SWR down to 1.5 to 1, especially on 15 meters where I find it very difficult to get a reasonably low SWR. Just my experience. Enjoy your TS-520!
73s, Scott, N6CIC

40671. For Sale, 2.1kHz filter for Kenwood 820

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-20 19:58:08 UTC
From: k8nb
Topic: 40671 Message: 40671

Hello all,

I recently picked up an 820 as a project. There was an additional filter in the radio in addition to the stock SSB and CW filter. This was on a separate board, and was not hooked up when I got the radio. There is no label on this filter however I did take it to work and measure it's response with a spectrum analyzer and tracking generator. It is centered on 8.830 and is a 2.1 kHz filter. I have posted pictures of the filter and the board it is on on Photobucket. Here is the link to the pictures:
http://s1286.beta.photobucket.com/user/K8NB/library/TS-820%20Filter

I would like to sell this filter. I have no further information on it and no hookup data. I would guess that it is an INRAD, but not sure. It appears it could be used as a cascaded filter, after the stock filters, or it could be taken off the board and used to replace the stock SSB filter.

I would like $50.00 for this filter and I will ship it in the US. Please contact me off list at k8nb@.... The first response gets it. Thank you for your time to read this.

73, Noel

Hi Rob
I own a two 520s a 530 and a 820.
I use a G5RV inverted V. VSWR is about 3.3 (not good)
A Kenwood tuner (or any manual tuner)for the rig will help some.
Anyway at least you will have a wattmeter.
I have an AT200 and do not use it much.
I do think it helps somewhat.
The rig seems to work fine with or without the tuner.

40674. TS830S: Adjustment of receive IF coils

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-21 19:37:26 UTC
From: ravnpeter@ymail.com
Topic: 40674 Message: 40674

According to the instruction manual the procedure for adjustment of receive IF coils is: "Adjust the DRIVE and the main tuning for maxium S meter deflection. Adjust T2 on the RF unit and L5, L6, L7, L11 and L12 on the IF unit for maximum S meter indication. DO NOT adjust L3, L5 and L9".

On one hand it says L5 should be adjusted. On the other hand you should not touch L5. So what to believe?

Thanks.

Peter, OZ8CTH

Topic: 40674 Message: 40675

Peter,
One of My 830 instruction manual says to adjust T2 on the RF board, then L3,L4,L5,L6,L7,L11 and L12. It says to NOT touch L9.
Another TS-830 Instruction manual I have says to adjust L5,L6,L7,L11,L12 but NOT to adjust L3,L4,L5,L9. Crazy.
I always use the procedure in the Service manual and have never had an issue.
The service manual says adjust T2 on RF board, then adjust L2,L3,L4,L5,L6L7,L9 and L11 for maximum S-Meter reading.
The Drive control should be Centered when doing these adjustments!

They never reissued the operating manual, B50-2738-00. The last two digits, in this case "00" indicate it was the first printing. It is peppered with errors. If you're going to do any any any service on any of these hybrids, don't be foolish and just try to use the operating manual instructions. It will take most likely take you and your rig to where you don't want to go. Always use the service manual instructions and try to use the most recent version.

40680. TS-830S CW Transmit Problem

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-22 04:16:16 UTC
From: baamaster
Topic: 40680 Message: 40680

I purchased a TS-830S last weekend, and it seems to work well except for one minor problem. If you have a key plugged in and not closed, and switch to CW mode, you hear the sidetone and if VOX is enabled, the rig is keyed.

If you unplug the key, it's fine. The plug is not shorted, and when the radio transmits via the VOX, closing or opening the key has no effect on the keying of the transmitter.

In short, when you plug in a 1/4 in phono plug, it keys the transmitter in CW Mode.

Anyone have any thoughts before I start tearing things apart?

Thanks,

Bill
KA4GAV

40681. Re: [TS-520_820_530_830] TS830S: Adjustment of receive IF coils

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 40674 Message: 40681

They obviously did more then one printing of the operating manual over the life of the TS-830S. Ideally, if no changes were made to the content, the part number, in this case B50-2738-00, was not changed. However, Kenwood documentation, and other Japanese company documentation, back in the 70's and early 80's, were very sloppy in many of their documents probably due to translation and not using real proofreading verifications. It probably wasn't uncommon to correct an error or typo in a subsequent printing and make no reference to it in the part number (the last two numbers). With this manual, the last page (since it only has locations) would not be considered a content page. If you look at the five digit number that follows the Copyright symbol on each back that you posted, you'll see two different numbers. Just like date of manufacture, Kenwood had some convoluted way of expressing year and week in their serial numbers and, in this case, when the document print took place. The letters with ( ) or a circle, I believe, had to do with what international region the manual/equipment was targeted for.

For any type of service related work, no matter how trivial, the service manual should only/always be used. The service manual was reissued three times. B51-0916-00, B51-0916-10, and B51-0916-20. If you really want to boggle your mind, following the part number for the service manual for the third edition (-20), there is (K), (W), (T), (X), the number 2 with a square around it, a G with a circle around it, and then the number 350.

40682. YK-88C-1 CW Filter - Reuse in the TS-530S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-22 14:46:52 UTC
From: k3jls@verizon.net
Topic: 40682 Message: 40682

Hello,

I just bought a TS-530S that has an SSB narrow filter. I'm not a big SSB operator, so I was going to look around for a narrow CW filter, perhaps selling the SSB filter on eBay.

Does anyone know if the plug-in YK-88C, YK-88CN's variants that are currently advertised on eBay can be removed from their plug-in 'carrier' and then soldered onto the TS-530's IF board?

Thanks - Joe - K3JLS

There have been a lot of replies to this thread, so I will be brief. I use either an LDG auto tuner or a MFJ manual tuner (Versa Tuner II) with my hybrids. I have several antennas, including a G5RV-Jr with 16 feet of ladder line, and with the G5RV-Jr I find the tuner is really needed on several bands to get the SWR down to 1.5 to 1, especially on 15 meters where I find it very difficult to get a reasonably low SWR. Just my experience. Enjoy your TS-520!

Hi Rob
I own a two 520s a 530 and a 820.
I use a G5RV inverted V. VSWR is about 3.3 (not good)
A Kenwood tuner (or any manual tuner)for the rig will help some.
Anyway at least you will have a wattmeter.
I have an AT200 and do not use it much.
I do think it helps somewhat.
The rig seems to work fine with or without the tuner.

40685. KENWOOD TWINS JR599 and TX599

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-22 12:22:33 UTC
From: Behiels JeanPierre
Topic: 40685 Message: 40685

Hi Kenwood members;

Is there someone on the usergroup who could confirm me,that the transceive interconnection cable of a R599/T599 (bronze frontplates)

the same is has for the JR599/TX599 custom deluxe version (silver frontplates)??

My JR599 has always been used alone,as stand alone receiver only.

Before I connect them in transceive with a TX599 transmitter,does I have to change something on the wiring of the transceive connector of the JR599..

Witch means can I direct connect both by means of the interconnection cable without change any wiring inside or so of my JR599 or TX599 ?

Why this question,because I use the JR599 longtime as stand alone equipment.

It is better to take some precautions before firering up this old gear hi !!

I am looking forward to any information around

Kindly regards Jean ON4AEF.

Hi Pete,
This leads to the question where to get hold of the 3rd edition of the service manual.
Those on the internet all seem to be 1st editions.

Just a comment about measuring SWR.

Most of the SWR bridges I am familiar with are designed for use with 50 ohm coax.

But a 1/2 wave dipole is closer to 75 ohms.

Heathkit made 3 SWR bridges that could be built for either 50 ohm or 75 ohm coax.

The Heathkit HM-11, HM-15, and the SB-630 station monitor all use the same SWR bridge. There are instructions in the manual how to set them up for either 50 ohm or 75 ohm coax.

If you are using your hybrid with a 1/2 wave dipole and 75 ohm coax it will work just fine. But 50 ohm SWR meters will not give correct readings.

You can use your hybrid just fine with a 1/2 wave dipole and no antenna tuner.

I don't mess with so called multi-band antennas. I do use trap dipole antennas. A 40M dipole with 20M traps will allow you to work 40M, 20M, and 15M without a tuner.

Sure a Dipole in FREE SPACE is 72 ohms but one in the real world is too close to the ground in most installations to be 75 ohms. Maybe a 10 or 12 meter ant would be hjigh enough but on 80M, for instance, You need to get a dipole up 250 ft to get near FREE SPACE performance.
In the average Ham's basck yard you are close enough to the ground to need to trim the length short due to capacatnce to ground etc. 50 ohms is a reasonable outcome.

Bill,
Do you have an electronic keyer hooked up to the plug? If you do, the keyer needs to be set on "Grid-Block Keying", or if it is on "Direct Keying" it will do as you are experiencing. If you are using a manual key, then I am not sure what the problem is.

Usually the key jack goes shorted when you remove a plug. A leaf swiching part of the jack does this. Maybe this part is bent over and touching when the plug is in!
Sometimes even a high resistance short can key the rig. do you have a plug with nothing wired to test with to see if a totally open plug will not key up when plugged in !?
good luck,
73...JD

Bill,
Do you have an electronic keyer hooked up to the plug? If you do, the keyer needs to be set on "Grid-Block Keying", or if it is on "Direct Keying" it will do as you are experiencing. If you are using a manual key, then I am not sure what the problem is.

I have the following filters that I will be putting up on QTH on Wednesday or Thursday, thought I would offer here first...
YK-88C (500 Hz bandpass).... $65 plus $3 to mail...Very nice...
YK-88CN (270 Hz bandpass.....$80 plus $3 to mail)... Very nice...
YK-88S1 (2.6 KHz bandpass(nice)... $60 plus $3 to mail)
Fox Tango (same as Inrad) 33H2.1 .... $45 plus $3 to mail
muRata CFJ455k-5 (2.4 KHz bandpass)..... $35 plus $2 to mail...
muRata CFJ455k-12 (2.9 KHz bandpass) hard to find... $50 plus $2 to mail...
All the above filters in nice condition...
PayPal OK if you can add a bit for part of the fee...
No trades...
Packed well...
Thanks,
Bob

Hi Kenwood members;

Is there someone on the usergroup who could confirm me,that the transceive interconnection cable of a R599/T599 (bronze frontplates)

the same is has for the JR599/TX599 custom deluxe version (silver frontplates)??

My JR599 has always been used alone,as stand alone receiver only.

Before I connect them in transceive with a TX599 transmitter,does I have to change something on the wiring of the transceive connector of the JR599..

Witch means can I direct connect both by means of the interconnection cable without change any wiring inside or so of my JR599 or TX599 ?

Why this question,because I use the JR599 longtime as stand alone equipment.

It is better to take some precautions before firering up this old gear hi !!

I am looking forward to any information around

Kindly regards Jean ON4AEF.

Hi Allen

Thanks for the information around.
I ask while I obtain this week a old JR599 receiver (Silver frontplate Custom Deluxe) witch has been used in the past for RX only(not in conjunction with a TX599)
I will be sure before connect to a TX599 (Silver frontplate Custom Deluxe) I do not make a short circuit or so.
I thought maby for RX use only,thay have made some brigdes on the connector or maby a rewired trannceive connector.
So if I good understood you could use a JR599 for RX only without changing anything on the back transceive connector (no brigdes or other rewiring) ?
In that case everything is staying originally and I can use my transceive cable with connectors of my other rigs R599 and T599 (bronze frontplates) for this purpose also !!
To be short : " the transceive cable on the back of a JR599 and TX599 in conjunction with a R599 or T599 are same"

Regards Jean ON4AEF.

Topic: 6768 Message: 40701

Rob,

You have gotten lots of good advice from the group, I will throw in my 2 cents for you to consider. Yes, you can run the TS520 without a tuner into a reasonably matched antenna with no problems at all. I use a TS520s and have used many different antennas since I like to experiment with wire antennas. 30+ years ago when I bought the rig, I soon found that even though I was getting good signal reports and having lots of fun making contacts with my set up, every once and a while I would tune up on a different frequency or band and find I had lots of RF floating around the shack. This was even with good grounding of the rig. Needless to say when you reach for a control or the microphone and get bit when you key up the transmitter, it is not fun! I eliminated 99% of the problem by always having an antenna matching unit between the station and the antenna. Initially I used a MFJ16010 random wire tuner and a CB swr meter. My current tuner is an SGC-239 smart tuner. I initially tune into a good dummy load, and then switch to my antenna of choice and the tuner takes care of the rest. I use a Bird 43 wattmeter inline from the transceiver and I can watch the tuning process occur. When it is done, I usually see about 100 watts forward and nearly nothing reflected. No more unexpected bites when I key up!

If you made your dipoles out of the 4 in dia. solid copper jacket coax that 100 kW FM broadcasters use it would be more broadband .
 RG 58 or 213 does not make much diff compared to # 12 wire ...I have read some articles about the "bazooka" dipoles.

Topic: 40682 Message: 40705

Hello folks.

I just wanted to repeat my question as I didn't see any answers to it and I was a tad too slow to snare one of those filter bargains. If I missed any response, I apologize.

Kenwood advertises a plug-in version of the YK-88C filter for their later solid state radios. It looks like the same hard wired filter used - for example - in the TS-530 placed on a plug-in kind of 'carrier' for the later radios.

My question is this. Does anyone think it would be possible to remove the filter from the carrier and then solder it to the TS-530's IF board?

The later model filters are more plentiful on eBay and other places, and even less expensive than the hard wired units.

Your thoughts?

Thanks,

Joe - K3JLS

Joe,

You can use it. I put one in an 830 I had a few years ago...but like a dummy...I sold it. : (

Good point John. Th bazooka has very poor radiation efficiency, and if you run a 1 KW amplifier on RTTY with one you will melt the center poly insulation......ask me how I know this. I feel it is a very over rated antenna.

If you made your dipoles out of the 4 in dia. solid copper jacket coax that 100 kW FM broadcasters use it would be more broadband .
 RG 58 or 213 does not make much diff compared to # 12 wire ...I have read some articles about the "bazooka" dipoles.

Hi Guys,
Butch Lewis (K0PSA) here and I have a question. Last night I was listening to two guys, one on a 530 and the other on a 930. They seemed to think that both radios were manufactured in 1981. I believe the 530 was introduced in 1981 and the 930 in 1982. Does anyone know if early 930's might have been built in 1981? I would appreciate any input.
Thanks and 73,
Butch Lewis

I wrote this down a long time ago:
Kenwood HF rig serial numbers follow the convention that the first digit
of the serial number is equal to the last digit of the year produced +2.
The next two digits tell you the month in the year. So if your Kenwood
serial number starts with "510xxxx", it was produced in October 1983.

Topic: 40711 Message: 40711

Hi members;

I am searching for a 50 ohm cable antenne interconnection cable for my Kenwood twins.
One end of the cable must have a male PL-connector and on the other side a male cinch plugplug.
Or any eady made source for sutch cable.
Made one by my own is difficult due difficiltys to solder a 50 ohm coax (RG58) to a small cinch plug !!
Ready made cables use a special design cinch plug for this purpose,witch I not have..
I have a commercial example witch fix this problem,but where to buy ?

I hope to get some information around or usefull tips or adresses.

Kindly regards Jean ON4AEF.

40712. Re: antenna tuner for TS-520

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-24 13:49:02 UTC
From: Steven Balliette
Topic: 6768 Message: 40712

With my TS-520 I use an MFJ-949d. My antennas are a 20m vertical 1/4 wave and an off center fed "almost 40 meter" dipole.
With my shack on the second floor grounding has been of concern to me. I have a #14 wire connected to copper plumbing for a safety ground. This is not adequate for an rf ground. When I first keyed the mic into the dipole my rf field strength meter on the shelf next to the rid when full scale. No shocks fortunately. After trying a series of choke baluns on the feed line (60 feet RG-8x) and getting only small improvements I cut a series of 1/4 wavelength wires, one for each band, soldered the ends together into a bundle and attached them to the ground lug on the tuner. The bundle of radials lay on the floor behind cabinets with the longer ends in a pile 10 feet away from the rig.
After this the field strength meter showed zero rf on all bands.
I do not know why this works. Can anyone explain it, please?

Steven KD0ETC

40713. hybrid missing link?

Greeting group

Strange thing...evolution...I have here a possible missing link: a TS-830S with the 520/820 power connector on the rear panel. It also has all the other "correct" plugs/sockets and one would normally see on the rear of an 830. As usual...I saved it from being aparts queen/junked...as it "doesn't power up." I still need to track down the exact problem...but it is on the rectifier board. I have looked at the power connections on the"radio side" and none of it matches with the 520/820 power schematic...and of course the 830 schematic is different and also does not match up. It came with no power cord. Has anyone in the group seen such a rig? I have not....I just don't want to blow it up. I have up-loaded a couple of pictures in the files section: "HYBRID missing link?"

Joe,
I have worked on one of those. In fact, if you can find a -00 Service manual for the 830, It shows the wiring of the plug you have.
If you can't find one, let me know and I'll scan this -00 I have here.

Thanks, Pete for your response. It makes perfect sense to me but using your formula I can't seem to come up to your result. Using your example the first digit, 5, plus 2 equals 7 and I don't see a 7 in your result. Help me out here, this is such an easy, sensible system I want it to work.
Thanks and 73s,
Butch Lewis

BE VERY CAREFUL HERE. The 12 pin plugs were only used with the W, T, and X type TS-830S transceivers. I suspect very few, if any, were ever originally sold here in the U. S. These plugs were intended to be wired into 220-240 AC lines. If you find a 12 pin plug and wire it up for 120 AC, be very careful on the necessary jumpers that are required inside the plug to power everything up. A wrong or incorrect jumper connection can lead to big nasty problems.

Right, if your first serial number digit was "5", which means it was manufactured in 1983 (5-2= 3) . I sure someone back in the day at Kenwood had "logic" as to why they identified it this way.

Pete,
Then 830M (Mobile) uses that plug and it could be wired for 120 or
12 volts.
I am looking at the 830M manual as I type this.

Although the TS-830M, which I believe is considered a "W" type, was not sold here in the U.S., the 12 pin plug diagram on Page 61 of the service manual should work wired for 120 AC. I believe only the "K" type TS-830S was sold off-the-shelf here in the U. S. Don't know if any of the other "types" could be special ordered by retailers. The main difference between the TS-830S and M, besides the 12 pin power plug, was the addition of the AM board, wiring, 6KHz filter, and associated parts and labels. Actually there were three operating manuals for the various "types" of TS-830S. Part Number B-50-2738-00 was the "K type", the B-50-2739-00 was the "T type", and the B-50-2740-00 were the "W and T types".

Thanks Pete,
The B-50-2740-00 operating manual was for the "W and X" not "W and T".
I'll be interested to see if the radio Joe has, has an AM board and also
what the board number is for the IF Board.

This sounded great, so I checked the serial number plates on my TS-820S and TS-830S.

It works for my TS-830S: s/n 2030162 = 1980 March

It doesn't work for TS-830S: s/n 730195 = 1985 ? 30 ?

And yes, I double-checked the s/n on the TS-830S to make sure I read it correctly. Any other insights? I thought I had read on this forum previously that there was no way to tell the year of manufacture from the serial number.

Thanks!
Mark kj4nxx

Opps! I was typing fast. Had the dinner call.
A true TS-830M, would have, besides the things I mentioned in the previous post, a different front panel, and a different label under the tuning knob. The panel would say for the MODE switch (left to right), TUNE, CW, USB, LSB, AM. The label under the tuning knob should say TS-830M. Here's a link to a picture of the TS830M:
Copy and paste to browser. Watch for link wrap around.
http://www.dh5sdl.de/assets/images/TS830.jpg

I tried many years ago to get an AM board from Kenwood but they weren't stocked anywhere in the U. S.

I would interpret that as manufactured in 1979 November. One needs to
know roughly the years of manufacture (start/stop) as a starting point.

40734. TS-530S - POssible Antenna relay Failure

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-26 04:48:05 UTC

Topic: 40734 Message: 40734

Hello folks - a quick question to those of you with TS-530 experience.

I just bought a really nice one, aligned it and was all set to make a CW contact on 80 meters. Prior to this, I had just make a 75 meter QSO with no problems.

So, as I was loading the rig up around 3.530, I heard what appeared to be arcing. So I stopped, and then tried again - same thing. I'm using a manual antenna tuner and the SWR was reasonably low.

After this, the radio seemed a bit deaf but would come back to life after hitting the PTT switch once or twice. This has all the obvious earmarks of a dirty antenna transfer relay, and I was wondering if anyone else had experienced this particular failure.

Again, all of the testing using a dummy load worked perfectly. It was just when I tried loading up on the low end of 80 meters that the problem occurred.

Now, I would imagine that I can clean this relay up (once I find it). I also have a good spare from an FT-101 that I cannibalized. And I know that new relays can also be purchased for around $35.

Any suggestions would be most appreciated.

Greetings group

What a "discussion" this stirred up. So to answer a few questions:

There is no AM board.
The "mode" switch has no AM position.
For all intents and purposes, this rig is identical to a "regular" 830S model, except for the power connection on the rear panel. It has all the "din" connectors and other "stuff"
on the rear panelthat are shown in my 830S "op" & "service" manuals.
The IF board that is in the rig is coded: X48-1290-00

I'll be "digging" into this unit over that next few days. I will attempt to take detailed notes and diagrams and post them to the groups file and/or picture sections as I find
out more.

It is also obvious that there has been "work" done on the rectifier board...diodes 8,9,10,11 have been replaced. I am missing voltage at "12" on the rectifier board &
"12" on the AF/AVR board. All other voltages on the rectifier board are present and within specs. There is also loss of some other associated voltages on the counter
unit....no digital display.

Joe

Arcing is never a good sign, saying that I had a new AT230 and it would arc across the fins when load on 80m, took it back under warranty got another new one. If you think it's the relay, check the one on the IF board aswell. The ANT relay is locate on the bottom side at the back of the radio next to the final board, under a tin can shield. Remember to discharge the radio's HV supply before you touch anything. The antenna relay can be a plug in type or a solder type, (both my 530s are plug in type). Relays are readily available.

Whilst you have the covers off, check the tubes. Any smell of burnt resistors or capacitors? Visually check the padder capacitors on the band switch in the final cage, these shouldn't affect receive.

Joe,

Have a 530 with a similar problem witht he digital board. Check the -6v supply, if good a common issue with the counter board in 830\530 is cracked tracks, this is usually where heavy handed gorillas have try to activate the warc bands and applied just a little too much pressure to the counter board. Once I bridged the cracks radio came back to life. Have a look at the attached photos as a reference.

Subject: [TS-520_820_530_830] Antenne cable for interconnect JR-599 and TX-599

Hi members;

I am searching for a 50 ohm cable antenne interconnection cable for my Kenwood twins.
One end of the cable must have a male PL-connector and on the other side a male cinch plugplug.
Or any eady made source for sutch cable.
Made one by my own is difficult due difficiltys to solder a 50 ohm coax (RG58) to a small cinch plug !!
Ready made cables use a special design cinch plug for this purpose,witch I not have..
I have a commercial example witch fix this problem,but where to buy ?

I hope to get some information around or usefull tips or adresses.

Kindly regards Jean ON4AEF.

Hi John

Yes it is this cable I need,where to find ??
I thought Cinch or RCA ar quit same ??
It is very diffciult to homebrew sutch cable,specillay soldering a RG58 coax to a RCA is quit unpossible.
I am looking for a commercial produced example.
Any adresses are welcome where I canb find one.

Regards Jean on4aef.

It might be easier to use a normal PL259 or BNC cable, with adapters to connect to the RCA. I have several RCA to BNC adapters that I use with my o'scope, so I know those exist. I would probably do it something like this:

Radio (RCA) -> Adapter (RCA to BNC) -> Cable (BNC) -> Adapter (BNC to PL259) -> Radio (SO239)

I know you can find ready made connectors and adapters to do this online.

A quick Google search found this:
Copy and paste to your browser
http://ceitron.com/shop/product_info.php?cPath=37_121&products_id=22816
Watch for link wrap around.

Sounds like what you need and the price is cheap.

Pete, wa2cwa

40744. Interconnection cable PL259 to RCA abt 4 inch long

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-26 18:54:56 UTC
From: Behiels JeanPierre
Topic: 40744 Message: 40744

I could use but.....
But what I search is a real cable with on one end PL259 and on other side a
RCA connector
Lenght about 4 inch long...

I really need a cable

Topic: 40748 Message: 40748

Hi folks,

I found the relay. I thought it was just 'plug and play', but I guess I was wrong.

Are they all 'hard wired'?

Joe

Joe,

Some are most are not, my original new 530 blew that ant relay, when it came back it was plug in, but cant find any retro fit Kenwood documentation. When I got my second 530 it was a plug in also. Where did you find the 530 relays??

Hi Dave,

I've ordered a MY2-DC12(S)from Mouser Electronics ($6) as a source on the FT-101 website recommended this relay as a replacement for the one in the FT-101 which supposedly uses that same plug-in relay as the TS-530. Hope that makes sense.

I still can't see if my relay is in a socket or is hard wired to the board. I don't want to apply undue pressure to it because it does work now - after a fashion.

I find it hard to believe that the manufacturer would hard wire a relay and not spend the extra $.20 for a socket. I just can't see if there is a slight separation between what I think is the socket and the body of the relay itself because the chassis is 'in the way'.

I'll let you know.

There are various relays for the various hybrids here:

http://www.hybridrestore.com/parts/

Today I took apart and cleaned both relays in my "new" TS-830S. Not a difficult job, if you're careful :)

Hi Dave,

So the factory standard arrangement for the antenna transfer relay is hard wired? That's odd, especially since the Yaesu folks designed the FT-101 relay as a plug in device and since the same relay can supposedly be used.

Well, I have to take apart the PA stage to replace one of the ceramic loading capacitors for 80 meters which apparently crapped out, so I might as well do them all and will put a relay socket on that board while I'm at it.

Further to this discussion, this store might not yield an exact match, but it's a good start. Their prices are very competitive.

40755. KENWOOD HYBRID USER NET (January 27th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-27 19:20:55 UTC
From: mvgilger
Topic: 40755 Message: 40755

The Saturday's net on 40 meter we had 26 stations checking with good band conditions. Out of those, there was:

7 running TS-520(x)
3 running TS-530(x)
2 running TS-820(x)
4 running TS-830S
2 running 599 twins
1 running TS-511

I was running a TS830. The rest were running non hybrids of one model or another. Mike, WB8WT checked in with one of his two TS-511's. It sounded great.

The Sunday 20 meter net we had 25 stations checking in under good band conditions. Out of those, there were:

3 running TS-520(x)
1 running TS-530(x)
4 running TS-820(x)
4 running TS-830S
1 running 599 twins

I was running a non hybrid TS-940. The rest were running non hybrids of one model or another. Richard, KJ4ZIZ picked up the net last Sunday, and did a good job.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70

January 2013, Saturday's, net total = 93, Sunday's total = 87 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

73's,
Mark, WB0IQK

All of the 530S TX relays that I have had have the relay on a pc board, don't know WHY Kenwood did that... :(

Bob,

Because it was probably initially cheaper. It was also a source of additional revenue when the relay failed (as they all will do at some point in time) and had to be replaced.

If you have a Toyota, you'll know what I mean.

I've ordered the socket and will install everything when it arrives this week.

73's - Joe

Thank you, Mark for running the net.

Special thanks for helping me test my processor and compression level. I'll leave it on and at the same level after your on the air tuning test and hearing a report that my S level was one higher with the compression up around 3/4ths with the processor enabled. I need all the help I can get barefoot with a highly compromised (low) g5rvjr.

Thanks again,
Stephen

In the 70"s some of the guys were putting these rigs in the trucks,cars, motor homes,and so on. Once they went mobile they found that they needed to be hard wired to prevent some of the vibration issues that were taking place. The trend was to make the units more versatile and dependable at the same time. They did not want the rigs being sent back because the darn relay shook out of the socket.

Sorry for the slow reply. I am in the process of fixing up another hybrid rig. On my previous TS-530s and 830s I made the steel sleeves that are in the photos section named "Drive Gear Repair on TS-530s & TS-830s". To fabricate these steel rings took quite a bit of time. I started with a piece of DOM structural tubing and machined it to the correct ID and then reduced the OD so that the wall thickness was not excessive but still plenty thick. The set screw holes are about 120 degrees apart. I just scribed them and drilled them large enough for the set screws to pass through, relying on the original threads in the nylon gears. Once all the machining was done I slightly roughed up the outer rim of the gear and degreased the new ring. I then mixed up epoxy, forced some in the split of the gear and then on both the inside of the ring and outside of the gear rim. I then layed the gear on a flat surface, aligned the set screw holes and forced the ring over the gear rim. I made sure the set screw holes were aligned and then inserted an oiled set screw in the holes, especially the one where the split was. If you do not do this the epoxy will fill the hole and then you will have to clean it with a drill and tap it again. I then cleaned off the excess epoxy and let it cure.

For this next radio refurbishment, I have found that two out of the three gears are split. I plan to sleeve them all. If they are not split already they most likely will soon. Also it is a bit of a project to disassemble and re-assemble and adjust. I would rather fix it once and be done with it. Another form member posted the idea of using 1/2" copper tubing. I measured the OD of the gear rim and then a scrap piece of 1/2" tubing and guess what they are both about .542". Perfect! Great idea! So for my current repair I plan to use the copper tubing. It is strong enough and requires only cutting to width and holes for the set screws. I will probably use my lathe to cut them but it is not required. I will post progress reports and maybe some pics.

Thanks & 73, Peter. KC2RBX

Only way you are going to be able to clean things up, Tom, is to dump the Yahoo email address and go to something like GMAIL. Yahoo is compromised..hackers are getting in above the password protection and spamming everyone from the various Yahoo email addresses. Changing passwords does no good..again, the attacks are coming from within Yahoo's servers.....no passwords needed.

As I have said all along...go with a free GMAIL account (They have the best spam filter of any of the email providers!) or buy a domain (address) from GoDaddy or similar provider.

Hi Ed,

No offense taken. There are situations where that may be the way to go. Maybe I was too quick on the trigger. Does Greg's tuner have a built-in swr meter? I made a few assumptions.

No, NO, you will not be able to adjust the tuner, the SWR reading on the SWR meter will never change. Connect SWR meter between rig and tuner !

Those are very rare, and if you can find one, it will be very expensive.
Having said that, one came up on Ebay about 2 weeks ago and didn't sell.
You can probably find the auction listed under the "completed" category,
and you might be able to contact the seller to see if it's still available.

You are correct, sir. Looks like he did a rewrite of the auction text.

They are nice receivers, but limited and aging. For a collector, they are a nice acquisition. I've had 3 of them over the years and enjoyed them and then sold them. For the price of that radio, you can buy, e.g., a TS-450Sat and have more receiver plus transmitter -- though not the uniqueness. And it is a magnificent looking radio.

Actually, I still have one I picked up a couple of years ago -- but someone messed up the i.f. board adding and deleting filters and I haven't gotten around to straightening it out. If anyone is interested . . . .

The ebay site said that that auction had been stopped by the seller because the item was no longer available. I assume that someone made an offer which, while it may have been refuseable, wasn't.

Those are very rare, and if you can find one, it will be very expensive.
Having said that, one came up on Ebay about 2 weeks ago and didn't sell.
You can probably find the auction listed under the "completed" category,
and you might be able to contact the seller to see if it's still available.

Hi folks, sorry, but I don't think that the MY2-DC-12S will work out. It's somewhat taller and wider than the original, and I'm not sure that the matching socket will fit the P/C board either. The socket arrives tomorrow so I'll do another post.

I wonder if Ken has a matching socket for his relay?

Joe

40783. Old meets new: TS-830S and Funcube Dongle Pro Plus

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-31 19:10:18 UTC
From: Mark L. Hammond
Topic: 40783 Message: 40783

In the FWIW category,

The new--For the last year+ I've been dabbling in SDR, especially with the Funcube Dongle Pro (FCDP)and it's newer brother the Pro Plus (FCDP+). http://www.funcubedongle.com/?page_id=1201 The FCDP+ includes HF coverage where its predecessor didn't.

The old--I recently bought a very nice used Kenwood TS-830S. There is an RCA jack with an 8.83MHz IF signal output. So I fed this IF into the FCDP+, set its frequency to 8.83MHz, and bingo! It gave me a 192kHz panadapter :)

Pretty slick fusion of the old with the new!

Of course the FCDP+ is a perfectly good stand alone receiver. So why bother with the TS-830S? Try to use an SDR receiver stand alone for making actual contacts with a transceiver and you'll quickly see why (do I use 2 antennas? How do I shut off the FCDP+ during transmit so I don't overload/damage it? How do I match my Xmit with my Rcv? etc.).

Turns out setting the FCDP+ frequency to 8.917MHz is the actual frequency that puts the TS-830S receive audio from the rig on frequency with the FCDP+ receive audio. Turning the dial on the TS-830S then keeps the xmit and rcv on the same freq. Don't think that's a FCDP+ calibration issue; still working the math to see the "why" of that (8917-8830=87?) Actually, on another attempt the offset changed--gotta figure this one out by spending some time with it.

Of course, using the FCDP+ also would allow a user to operate split DX stations--without the extra external VFO. Actually, it's rather like the VFO-230 and SM-220 plus BS-8 rolled into one!

Over the weekend I'll try to take a little video and post it on Youtube.

Please note--the "cheap dongles" don't work on HF, since they don't cover HF. There are HF upconvertors....or a cheap Soft Rock with the right xtal would work too of course.

Anyhow, fun to play.

73!

Mark L. Hammond [N8MH]

40784. TS-830S and Ip meter reading question

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-01-31 19:28:19 UTC
From: Mark L. Hammond
Topic: 40784 Message: 40784

As per my previous post, I recently bought a very nice TS-830S. The only thing I could see wrong with it was the broken plastic coupler on the band switch (imagine that...hi hi). Metal replacement coupler should be in the mailbox soon for replacing1

I'm still working on putting it through all the paces. It's very clean, doesn't look hacked up at all, has both 500Hz CW filters in it, and all caps look to be original. I've cleaned the relays, careful cleaning and Deoxit of pots and wafers, etc.

Question about one thing I'm seeing---I swear the meter is reporting Ip current incorrectly--as in if I tune up with a "reasonable" carrier level (9 O'clock ish?), then check Ip on transmit in CW mode--it's full scale or nearly so, reporting over 300 mA. Power out is about 100W (depends on band, etc). If I reduce carrier to put reported Ip at 235 mA, it is putting out around 40-50 Watts. Bias is at 65mA.

I'm being careful and trying to keep transmissions short of course. If I put Carrier at min and then increase, there is a point where Ip doesn't seem to get any higher with increase in carrier setting--but the meter is reporting nearly full scale when that happens. Scary.

This is clearly different from what I see on my TS-520--that rig is pretty much "maxed out" at 235mA or so when adjusting the carrier to a certain point.

Not sure I'm being clear--but I hope clear enough to get some advice.

Is there a likely suspect for the above observations? I've searched the messages and the only thing that seemed relevant were some references to R6.

I'll appreciate some tips or advice. I'm learning...slowly, but surely...but a nudge in the right direction will be appreciated!

73,

Mark L. Hammond [N8MH]

Check the value of the final tubes' cathode resistors with a good ohmmeter.
a shift in value will give false IP readings on the rig's meter . They may have been overheated in tune ups by someone not careful about how long they ran excessive plate current.

The point where the Ip stops increasing is the same point where the ALC metering shows a reading. The automatic drive limiting starts to take effect here.

Mark,

I agree with Gordon. The 4 x 20 ohm resistors on the final amplifier board are more than likely way out of spec. Being in parallel...they should read approx 5 ohms to ground +/- tolerance. The higher the value...the more incorrect your Ip reading will be. While you're in there..you can replace the 100 ohm screen R's(there are two) too. I will do all as a "routine" if the cathode R's are out of spec. Resistors are cheap...keep desoldering those solder pads too often and removing a trace...life become more difficult.

Replace with same value and wattage! I use metal film myself.

Thanks to Joe, Gordon and John. Great tips and confirms what I thought I was reading and seeing on the schematics. I really am trying to learn something as I go.

I ordered the "resistor kit for final repair" RK-53 from K4EAA along with the metal shaft coupler so I'll replace all of them when I open it up this weekend. It's 4x20 ohm, 2x100 ohm, and 1x470 ohm.

Am I correct that the supplied single 470 ohm resistor is to replace the one on the rectifier board labeled R11? Pretty sure I have that right...but I'd rather ask, than just guess!

I might install the HV caps while I'm at it..we'll see. I hate to do too much at once, in case something goes wrong. Easier to troubleshoot if done incrementally.

And while the full recap of TS-520 scares me, I think I could handle the TS-830S! At least the boards have connectors and not wire-wraps ;)

Mark,

Replace the caps at the same time. The 470 ohm resistor is from the rectifier board, always a good idea to replace that when doing the cathode resistors (4x20). I now also replace the 2x 56K resistors on the rectifier board at the same time, I've had a couple of radios that had similar issues as yours and after replacing the HV caps and cathode resistors, had R15 (56K) on rect board die a short time later. Also check the small ceramic plate choke C7, and L1 RF choke, more than likely you'll find these either charred or discoloured. Remeber to completely discharge the HV system before putting your fingers in there.

Regards,

Dave

Hank
The tuner is a MFJ 941D. Antenna is a 10 meter dipole. I also have a Hustler vertical 80-10 meter antenna that I am waiting on warm weather to install.
Thanks for the reply's.

Rick
The MFJ tuner has a swr meter but the Swan meter is so much larger and easier to read. (Also looks good).
Thanks
Greg

Thanks, Dave. Sage advice. Fortunately, I have all of the suggested parts on hand!

Always appreciate the discharge reminder, too.

>Replace the caps at the same time. The 470 ohm resistor is from the rectifier board, always a good idea to replace that when doing the cathode resistors (4x20). I now also replace the 2x 56K resistors on the rectifier board at the same time, I've had a couple of radios that had similar issues as yours and after replacing the HV caps and cathode resistors, had R15 (56K) on rect board die a short time later. Also check the small ceramic plate choke C7, and L1 RF choke, more than likely you'll find these either charred or discoloured. Remeber to completely discharge the HV system before putting your fingers in there.

Topic: 40797 Message: 40797

Dear amigos:
I was talking on the 40 meters band this afternoon, all OK... suddenly
the TS820S
did not received the station I was having a QSO with... only a strange noise
came out of the loudspeaker. When I tried to transmit, the Ip went up OK
but no one heard me. Monitoring on another transceiver, all that could be
heard was a noise that followed the speech pattern.
I changed bands, and 20 meters sounded normal, and also checked 80 meters
and could monitor my transmission on that band. Later 40 meters sort of
made a comeback but only up to around 7050 kHz, because from that frequency
up only noise was heard.
I suspect that this may be a PLL related problem !
Any advise from list members having to deal with the same problem, possibly
unlocking of the PLL circuit ....
Please reply to inforhc at enet dot cu and also post your reply here,
because
I am having difficulties with the YAHOO servers

Mark,

The 470 ohm resistor in Ken's kit is indeed on the rectifier board. John also makes a good point about the two 56k resistors also on the rectifier board...I think they are R-15 & 16. When these go way out of spec...you see the "no ALC in tune" problem. Again while you're there...why not. Just go easy when lifting and rotating the board...there are wire wrap posts here..and I have inadvertently broken a wire or two by being too "ham fisted." No joke intended....hihi

Make sure you also have a LONG allen type wrench to get at the set screws on the old coupler and also the new one. It is 1.5mm. Double, triple, quadruple check your band switch, shaft, "wafers" position upon replacing the band switch.

While those nice "molex" connectors are great if you have to remove a board...those thing can create their own problems. If messed with too often or to "ham fisted," you can crack the solder connection on the foil side...or pull the whole dang thing off the board. Please don't ask how I know.

Good luck....

73 Joe

Subject: Re: [TS-520_820_530_830] Re: TS-830S and Ip meter reading question

Thanks to Joe, Gordon and John. Great tips and confirms what I thought I was reading and seeing on the schematics. I really am trying to learn something as I go.

I ordered the "resistor kit for final repair" RK-53 from K4EAA along with the metal shaft coupler so I'll replace all of them when I open it up this weekend. It's 4x20 ohm, 2x100 ohm, and 1x470 ohm.

Am I correct that the supplied single 470 ohm resistor is to replace the one on the rectifier board labeled R11? Pretty sure I have that right...but I'd rather ask, than just guess!

I might install the HV caps while I'm at it..we'll see. I hate to do too much at once, in case something goes wrong. Easier to troubleshoot if done incrementally.

And while the full recap of TS-520 scares me, I think I could handle the TS-830S! At least the boards have connectors and not wire-wraps ;)

Very helpful, Joe. I do see R15 and R16 as being the 56k resistors. Should be in my goody box.

And thanks for the reminder to be gentle with traces, etc.! It would be startling to lift something...

Topic: 40800 Message: 40800

Email Hacked:\

Good afternoon my email had been hacked since I also have accounts both with the State and U.S. Government they have automatically notified me and sending someone to my resident to inspect my computer and software, it seem they want the hacker as much as I do.

Allan Sorry about the SPAM.

40802. TS-830S - 1W power out?

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-02 21:13:09 UTC
From: rolandver109
Topic: 40802 Message: 40802

Hi
I am now a pride owner of a Trio TS-830S, bought it as a" for parts ☐ no receive, no transmit" After 6 hours of work receive is working, but transmit is only 1W? (Cleaning the relay on the AF board fixed receive)
There where a couple of strange mods in the final that I could not figure out the meaning of.
- A diode, 1N4007 type, in series with final "SG" power input
- A NTC resistor in series with final "DRV" drive inout´
- A short wire on drive bord R36/LR36 to "DRV"
I removed al of this but does get no more than 1W output power when tuned against a 50 Ohm dummy load (in series with a power meter).
(I am rather new to "tubes" ☐ I am basically a analog "transistor man.)
I have measured the following signals / voltages_
- Final drive input ☐ 2.5V RMS AC, max 4.2V RMS AC(full AFC), 14.2MHz (Measured with a digital osc.)
- Final tubes pin 5, receive 95V, and transmit 50V
- Final tubes pin 4, receive 239V, and transmit 207V
Anode voltage is about 670V as I remember.

What could be wrong ☐ where should I begin the fault tracing? Is the drive voltage sufficient?

Regards/Roland

40803. Re: [TS-520_820_530_830] TS-830S - 1W power out?

Topic: 40802 Message: 40803

Roland,

Congrats on getting it to rcv. There is also another relay...under the metal shield next to the final board. The relay..RL-1 on the AF board can and will cause lots of malfunctions as it controls numerous functions on RCV & XMIT.

I have not idea why someone would put a diode in the SG line....or why really put a resistor in the DRV line.
What board are you refering to when you say "on the drive board" Do you mean the RF board?

With rig on, "heater" on, rig in RCV: final amplifier tubes (6146B) pins 1, 4 & 6 = 0.0vdc

pin 2 = 0.0vdc

pin 3 = 266vdc

pin 5 = -106vdc(minus 106vdc)

pin 7 = 0.0 vdc

pin 8 = 0.0vdc

"SG" = 266vdc (same as pin 3)

"FG" = -106vdc (same as pin 5)

These voltages may be slightly higher or lower on your rig..but should be close.

Look close at the rectifier board to see if the wiring is different from the schematic...moving a couple of wires is a common QRO mod.
Check for proper voltages there too

Do you a a service manual? If not, look at Gordon's web site: n6wk.com you can find a service manual. Look on Pg 44 is gives you levels
to check for RX/TX.

The HV of 670 is a bit low...but would not account for the 1 watt? Is the 1 watt on all bands?? You could have multiple failures, including, bad 12by7a driver,
bad final tubes. A very common problem is also a loose/cracked band switch coupler...it's on the end of the band switch shaft just inside the final cage. If cracked/broken S-22 in the final cage will be out of sync with the rest of the TX chain and may also be a cause of your problem. With rig OFF and UNPLUGGED...let sit for a bit, remove top and bottom cover, then remove screws holding the cover over the final cage. With

a good INSULATED tool, touch from the top of the wire wound
ceramic form between the top of the two final tubes to ground...then check with a meter set on VDC from there to ground to make sure there are no volts there.
Remove most forward tube...use a bright light light and inspect the white nylon coupler for cracks. If cracked...it can not be "glued" it will have to be replaced.
To check for proper orientation/alignment put band selector knob pointing to "10"...the shaft has flats the should be on the left and right...the rounded parts should
be on top and bottom. Each wafer has a white plastic center section...with a small circular depression...all those should face to the LEFT. Looking at the final cage
area...the small shaft on the the tank coil selector switch which connects to the band switch connector should show one "flat" facing down or "6 o'clock and the
other at 3 o'clock...looking right back at you. Any other orientation ...it's outta whack.
The set screws are 1.5mm there are 4

The fine copper wire on the ceramic form should be relatively clean and bright...if it's dark/black...this indicate severe overheating.

Topic: 40802 Message: 40804

G'Day All,

The below information was given to me to help me learn, hopefully this will assist in the continual matched verus unmatched tube issue and help with a better understanding of what is occurring inside our radios

Class of operation of our Kenwood driver tube and final tubes

In our Kenwood hybrid rigs the Driver Stage and Final Stage tubes are biased to ensure Linear Operation so that we reproduce the SSB audio without distortion. By distortion we are not so much concerned about voice intelligibility as we are the generation of Intermodulation Distortion or IMD products. Although, severe distortion of the SSB envelope can result in a gravelly sound to the voice it is not a primary concern. The Human voice is composed of many tones. When the SSB envelope is distorted a great number of new frequencies are generated consisting of sum and difference frequencies of all the harmonics. These are spaced equal to the difference frequencies and extend outside the original channel width. The Tank circuit does a good job of attenuating the even order products especially the 2nd harmonic, but does not adequately suppress the odd order products and the 3rd order is especially troublesome as it lies close to the operating frequency. If you look at the TS-830 transmitter specs you can see that the 3rd order suppression is > than -36dB. This means the 3rd order products are > -36dB below a single tone of a 2-tone test.
In summary the Kenwood hybrid tubes are biased to permit linear operation and per the terms of our licenses we are required to operate the transmitter in a matter that does not result in IMD products that cause adjacent frequency interference ie splatter or buck-shot.
The Class of an RF amplifier is defined by the degrees of conduction of Plate current flow in relation to the RF input sine wave cycle of the driving signal. Class A means Plate current flows for 360 degrees or 100% of the input RF sine wave cycle. Class A has a maximum theoretical efficiency of approx 50% and in practice 25% to 30% is attainable. We establish the Class of operation by setting the control grid or grid 1 negative dc bias voltage to produce a certain resting plate current on the load line. Some refer to this current as the "bias". This is not correct. Bias is not current it is voltage and with vacuum tubes normally a negative voltage is applied to a control grid nearest the cathode. We apply a negative voltage to the control grid to cut the tubes off in RX mode and a lower bias voltage level to turn them on to a certain current level (Class) in TX mode. The bias is the negative voltage level that produces this level of current. This resting current is called the quiescent current or Q-point.

Kenwood Hybrids tubes and what Class do they operate?

The 12BY7A Driver stage is operated in Class A. The 12BY7A Driver tube is biased so that plate current flows 360 degrees or 100% of the time that a RF signal is applied from the output of the Transmit Mixer to the control grid Pin 2 of the tube. This rf signal level from the Transmit Mixer is approx 2.0 to 3.0 volts rms at the actual transmit output frequency. The Driver tube takes this 2 volt rf signal at its control grid and varies the plate supply to produce approx 60 rf volts output.

In the TS-520 rig Pin 2 is biased to cut-off by approx -37vdc in RX mode and is biased to Class A operation by approx + 0.30vdc in TX mode. This biasing results in plate current flowing 100% of the time. So how much is the plate current of a 12BY7A and how much power is it producing? Well you can easily calculate Cathode current by using Ohms Law and dividing the cathode voltage by the cathode resistors value. Note: Cathode current is what the Ip meter position on our rigs measures for the 6146 finals. It includes the screen grid current. It is close enough for discussion purposes to call it Ip or Plate current.

For a TS520 3.8vdc/ 148ohms = 25.6 ma of cathode current. So for sake of this discussion we can just call this the Driver tube Plate current. If you look at tube data sheets for a 12BY7A tube you will see maximum plate current is approx 27ma so you can see that Kenwood is running the Driver tube in Class A to just about to its maximum. That is why the tube runs as hot as it does. So how much power are we talking about with the Driver tube running in Class A? Well dc input power by Ohms law is Plate voltage x Plate current or 293 vdc x 25.6 ma = 7.5 watts DC input power. The Driver tube produces a nominal 7 watts of dc input power at the actual transmit output frequency.

A Class A amplifier is very inefficient at converting the DC power supply into a linear reproduction of the rf envelope applied to its input grid. If we assume 30% efficiency then the approx output power is 7.5w x .30 = 2.25 watts. The output power of our Class A 12BY7A Driver tube is nominally 2 watts. We have a Class A rf amplifier producing approx 2 watts output power available to drive the control grids of the finals. The output signal of the Driver tube is a faithful reproduction of the rf input signal.
This brings up a point about the tube shield. As mentioned above the tube produces a lot of heat due to 360 degree plate current flow. This heat is generally due to the kinetic energy of the electrons striking the anode. The heat produced at the anode surface is radiated from the anode to the glass envelope and to the surrounding air. The black coated tube shield serves two purposes. 1. It helps conduct the heat to the air currents around the tube and 2. It shields the input (grid) from the output (plate) to ensure no positive feedback occurs causing the tube to break into oscillation. We want it to be a linear amplifier and not an oscillator.

People do run the rig with this factory designed and installed shield missing with no apparent ill effects, however it is best to run with it on. It is not easy to determine the negative effect on tube life by running without the shield. Also a "silver" shield should not be substituted. It would provide the necessary shielding, but is not as effective a heat radiator.

Lastly, it should be noted that later Hybrids models introduced RF Negative Feedback to the 12BY7A Driver Stage to further improve linearity. A low level rf signal from the output of the 6146 finals is coupled back to the cathode of the 12BY7A. This signal is 180 degrees out of phase and reduces the stage gain and improves stability and linearity of our Class A amplifier.

RF PA Linear amplifiers?

The PA stage must also be Linear. Linear RF amplifiers in Ham service include:

1. Class AB1 = The tube control grid is biased so that plate current is varied approx 60% of the input RF signal sine wave cycle at the control grids. The missing 40% is supplied by the flywheel action of the tank circuit. In Class AB1 you must not allow the control grid to become positive or distortion will result. The input rf envelope will be clipped due to moving the operating point on the load line. This distortion results in adjacent channel interference as described above. Therefore, grid current must not flow in a Class AB1 rf amplifier. In Class AB1 no drive power is required only drive voltage. We adjust the operating bias of Hybrid rigs from around -50vdc to -60vdc depending on the radio. This results in a resting plate current or quiescent point of approx 60 ma. So we make a trade off of slightly more distortion for an increase in efficiency from Class A 30% to Class AB1 55%.

2. Class AB2 = The tube control grid is biased with a slightly higher negative voltage moving the resting plate current lower on the load line (toward Class C) and allowing a small amount of grid current to flow during the positive portion of the rf driving envelope. This results in distortion in the SSB signal. To address this out of phase RF negative feedback is employed to reduce the stage gain. As noted above distortion of the SSB signal is undesirable as it causes adjacent frequency interference. Class AB2 is close to 60% efficiency.

3. Class B = Tube control grid is biased with higher negative voltage moving resting plate current lower resulting in plate current conduction of 180 degrees. Class B would result in significant distortion in SSB operation. Class B maximum theoretical efficiency is approx 78% and in practice closer to 65%.

4. Class C = Tube control grid is biased with a high negative voltage that results in a plate current conduction of less than 180 degrees. In practice the tube Plate current is nearly cutoff and the tank circuit produces the rf output sine wave. It is not possible to use Class C for SSB operation. Class C is used for CW Mode or other on-off keying modes.

A word about efficiency:
The efficiencies above are listed as approximate and you can find differing values for vacuum tube Class of Operations including differing maximum theoretical values in various engineering texts, handbooks and Google searches. What really matters is we are not just talking about the efficiency of a vacuum tube biased to a particular class of operation. What we are really interested in is what is known as Power Added Efficiency or PAE. PAE is a measure of the RF linear amplifier efficiency in converting DC power of the Plate supply to the actual signal power delivered to the load ie dummy load or antenna. Any power not delivered to the load is dissipated as heat. So technically it is not correct to simply multiply DC input power by tube Class of operation efficiency and call that output power. For sake of simplicity this approximation is used in this paper. It is pointless to argue if Class AB1 is 55% vs 60% efficiency for the understanding of what Class AB 1 is and how

it affects the 6146 tube operation in a Kenwood Hybrid. This paper does not discuss how a vacuum tube in RF service converts the DC plate supply to an RF output signal nor does it address where other inefficiencies reside such as within the tank circuit. It is sufficient to say that PAE will normally be less than tube Class of operation efficiency.

40807. RE: [TS-520_820_530_830] Kenwood tube education 4 of 4

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-02 23:19:46 UTC
From: fpath fpath
Topic: 40802 Message: 40807

So what does this mean for the Hybrid 6146 finals?

The Kenwood Hybrids use a pair of 6146 finals in parallel biased to Class AB1 operation. Note the tubes are not in push-pull configuration and there is no requirement to use "matched" pairs. Even so called matched pairs of 6146 tubes have slight differences and there is no provision provided to individually adjust the bias voltage on each of the final tubes to account for these differences. Bias voltage is set the same for both tubes and there is no way to measure or monitor how each tube is sharing the indicated resting plate current or full load current.

We adjust the operating bias voltage on the control grids from approx -50vdc to approx -60vdc depending on Hybrid model which results in approx 60ma of resting plate current. Our goal is to bias the 6146 finals to Class AB1 operation. We only have grid current flowing when tuning/loading the rig or when modulating and overdriving in SSB mode. Since we do not have a Grid current meter position how do we know how much grid current or RF drive we are using? We use ALC indication for this. Since the rig uses ALC as a servo loop to reduce overdriving the rig Kenwood elected to use it in lieu of adding additional meter shunts and meter switch positions to display actual grid current. Most if not all the early transmitters used a grid current meter position to set the RF drive level.

When loading the rig we intentionally cause grid current to flow by causing the RF sine wave envelope on positive peaks to exceed the negative grid bias voltage on the control grids of the 6146 tubes. When this occurs the grid becomes positive and attracts electrons being emitted by the cathode. Those electrons flow from the grid of the 6146 finals back to the -C bias supply. This current is very small on the order of 30 to 40 micro amperes.

On the path back to the -C supply this grid current flows thru the base bias resistors of the ALC amplifier transistor. The transistor collector is hanging on the ALC bus line and acts like a voltage controlled resistor. When the transistor is biased on by the 6146 grid current it pulls the ALC bus voltage down reducing the gain of the Transmit IF (TIF) amplifier which reduces the output of the Transmit Mixer which is driving the 12BY7A Driver tube. So with ALC indication the output power of the Driver tube is reduced from its nominal 2 watts and the rf drive to the 6146 finals control grids is reduced causing the grid current flowing to be reduced and restoring Class AB1 linear operation. Note: In SSB mode and we have ALC indication on the panel meter with voice modulation we are producing pulses of grid current at an audio rate any time the positive going peak of the rf envelope exceeds the dc bias voltage offset. This is different from when we are loading the rig and have a constant low level of grid current flowing.

The S-meter measures the ALC bus line voltage in TX Mode and when it senses the ALC bus line voltage going down it causes the meter to move up scale. None of the scales mean anything relative to ALC while loading the rig (that includes the black rectangular ALC box). So called experts routinely direct and caution new Hybrid owners to peak the Drive Control to set ALC indication in the middle of the black ALC box. There are You Tube Videos produced by Extra Class holders teaching this method. This is bunk and shows no understanding of how the radio works or what you are doing when loading the rig. You simply

peak the Drive control for the maximum indication anywhere on the meter. 2/3 to 3/4 scale with Car Pot level at 1000 to 1100 range provides a good place to see a peak and also lets you know that the Driver tube has good emission. This peak means you have tuned the Driver tube grid and plate tuned circuits to resonance and you have maximum drive being applied to the control grids of the 6146 finals.
During SSB mode to ensure linear Class AB1 operation you do use the black rectangular ALC box on the meter face. You adjust the mic gain until you see deflections in this box.

On early versions Kenwood instruction manuals directed you to operate the mic gain to produce deflection in the upper portion of this black box as they used ALC as a form of speech compression for more talk power. They did this by setting the release time constant (approx 5 msec) faster in SSB mode to increase the average to peak rf output power. This means that the ALC bus voltage more quickly returns to near RF-1 level after being reduced by ALC fast attack time constant (nearly instant). Approximately 6 dB of compression was claimed. Later generation rigs with audio or rf compression circuits directed you to just ensure that ALC indication remains within the black box. Ideally if this black box was accurately calibrated you would increase the mic gain until you just see flickers of deflection and then back down the mic gain, but this is not necessary and operating with ALC indication within the black box does not result in significant adjacent frequency interference or buck shot even though technically any time ALC is indicated it means you have 6146 control grid current flowing and you are no longer operating at the technical definition of true Class AB1.

What difference does it make if I set the operating bias voltage so that I have 50ma instead of 60ma? Isn?t this better for my 6146 finals?

You can set the bias voltage so that you have a range of resting plate current from approx 50 ma to 60 ma and not significantly affect the Class of operation. It is not critical and will not result in significantly more distortion or measurably longer or shorter tube life. For the TS520 operators who have very low ALC indication on 10 meters they can try adjusting 6146 control grid bias voltage to a lower value which will result in higher resting plate current (moving tube toward Class A). This may produce more ALC indication as grid current flows when there is a difference in negative grid bias voltage and the positive peaks of the RF drive voltage. You need no less than approx 39 rms rf volts drive applied to the control grids to overcome the offset that the negative grid bias voltage establishes. If you have no difference in grid bias voltage and the positive peaks of the RF envelope there will be no 6146 control grid current and therefore no ALC indication.

40808. 16 Pin Connectors for use on the Kenwood Twins and the R-820 receiver

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-03 02:19:25 UTC
From: n6wk_skcc3
Topic: 40808 Message: 40808

I have just (4) left of the brand new never opened 16 Pin Hirose Connectors that Kenwood used on the Kenwood Twins, T-599/R-599 radios.
These are also used when connecting the R-820 to the TS-820.
These are hard to come by. These are the last 4 I have left.
Cost is $30.00 each plus shipping.

Don't miss out if you have twins and need the connectors to make the interconnect cable.
I also have (1) of the 12 Pin Hirose connectors used on the Kenwood Transverters. Same Price.

73,
Gordon

40809. KENWOOD HYBRID USER NET (February 3rd, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 40809 Message: 40809

The Saturday's net on 40 meter we had 24 stations checking with good band conditions. Out of those, there was:

5 running TS-520(x)
3 running TS-530(x)
3 running TS-820(x)
5 running TS-830S

I was running a TS940. The rest were running non hybrids of one model or another.

The Sunday 20 meter net we had 27 stations checking in under good band conditions. Out of those, there were:

7 running TS-520(x)
0 running TS-530(x)
4 running TS-820(x)
2 running TS-830S

I was running a non hybrid TS-940. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70

Hey Michael,
I may be able to help you out. I have the TS-520 external VFO and the SP-520 speaker. The speaker works and the VFO lights up when selected with the TS-520. I built an umbilical cable to test it. I don't have an antenna (or decent ground) at this time. I have a MC-50 mic also but am saving that to sell w/the TS-520.

Hi Mark
I'm keen to hear how you progress with this. Having just acquired a nice TS-830S myself, and already owning a LP-PAN panadapter running at 192kHz wide I think its a great idea to merge the old with the new! I'm looking forward to the Youtube clip!

Hello to all. My name is Rick and I'm a "newbie" around here. I've been a ham since 1961. I run a few different stations from the shack but my favorite is still my old TS-520. It was my first transceiver. Previously I had either pieced together a station or built it. I have the matching speaker, VFO, Tuner, Phone Patch (not that it gets any use) and digital readout which I am having a tad of trouble with at this time. I'm in the process of soldering a small wire through all of the plated through holes connecting one side to the other. I'm almost 68 years old and my eyes and hands don't always do what is asked of them, so, this is a tedious project. I hope it pays off.

Thanks for having me!
Rick / K5IAR

Bryan:

Well, it's a simple question that's not so simple, it turns out. We have discovered, by trial and by chance, that the numbering of the pins on the connector can differ with otherwise interchangeable connectors made by different companies.

Some time back a group member asked that we describe the positions of the connections rather than by pin number, and I did so (coming close to electrocuting myself as part of the investigative process as well). He claimed that the connector he had was numbered differently than the ones we usually see. That seemed improbable until I stumbled across the fact that different makers number them differently.

So I recommend you do a search for posts by me to get the info in a format that will work, regardless of the numbering. I also will see if I wrote it down somewhere and post it again if I can locate it.

Good Luck!

Welcome Rick!

I assume you mean the external digital readout for the 520? I have two 520's but neither have that accessory. But I did have problems with the digital readout on my 820S and like many people found that the it was associated with the connectors that connect the two sections. So if there are any such connectors, you should try cleaning those first.

Good Luck!

Great video Mark, I am also interested in using the IF outputs of my TS-820 and TS-830 for SDR inputs. I have built one Softrock receiver and plan to build another to cover the 8 MHz frequencies. Should I be concerned about impedance matching or overdriving the SDR receiver with the IF input?

I think this thread is quite relevant to the old hybrids as it gives them state of the art display capabilities.

Thanks,
Skip KC4QP

Hi Skip,

Yes, a new soft rock kit with 8.83 xtal is about $25! Nice bargain. Of course you have to power it, put in a case, and have a sound card--but that's easy. The FCDP+ is slick since it's one piece and a single USB connection.

I can't comment about the impedance issue or the signal level. On the FCDP+ I could adjust the gain so I wasn't concerned.

One of the cool things is that the radio 'almost' becomes computer controlled. Using SDR-Radio Ver2 I can connect from work and listen to the TS-830! It is limited to about 192kHz of bandwidth, but figure if you put the rig on 14.250, that's around +/- 90 kHz on either side. Not too shabby!

So maybe you can teach an old dog new tricks!

73,

Mark N8MH

>>> Of course the FCDP+ is a perfectly good stand alone receiver. So why bother with the TS-830S? Try to use an SDR receiver stand alone for making actual contacts with a transceiver and you'll quickly see why (do I use 2 antennas? How do I shut off the FCDP+ during transmit so I don't overload/damage it? How do I match my Xmit with my Rcv? etc.).
>>>
>>> Turns out setting the FCDP+ frequency to 8.917MHz is the actual frequency that puts the TS-830S receive audio from the rig on frequency with the FCDP+ receive audio. Turning the dial on the TS-830S then keeps the xmit and rcv on the same freq. Don't think that's a FCDP+ calibration issue; still working the math to see the "why" of that (8917-8830=87?) Actually, on another attempt the offset changed--gotta figure this one out by spending some time with it.
>>>
>>> Of course, using the FCDP+ also would allow a user to operate split DX stations--without the extra external VFO. Actually, it's rather like the VFO-230 and SM-220 plus BS-8 rolled into one!
>>>
>>> Over the weekend I'll try to take a little video and post it on Youtube.
>>>
>>> Please note--the "cheap dongles" don't work on HF, since they don't cover HF. There are HF upconvertors....or a cheap Soft Rock with the right xtal would work too of course.

>>>
>>> Anyhow, fun to play.
>>>
>>> 73!

Hello,

I have a TS-830 that I am trying to bring back to life and could use some advice. Here is what happened.

A couple weeks ago I was tuning up my 830, I had dipped the meter in "tune" mode and all looked good. I switched to CW and as soon as I hit transmit there was a soft POP and plate current dropped to zero.

I opened up the radio and found one of the cathode resistors was cracked. Using parts from K4EAA's website I replaced the the screen and cathode resistors. I put everything back together and still no output.

I do have HV according to the meter, but have not actually probed it.

I do see ALC output on the meter.

I still see no plate current.

I have made sure the SG switch on the back is on.

What should my next step be in troubleshooting this radio?

Hello all,
I have a ts520se and I noticed something strange the other day. I was on 10m and suddenly all power went and I had blown the fuse. After changing the fuse I notice that on twenty meters now I can only get 50 watts before it was 90 to 100 watts.

I am wondering if the tubes have now gone soft and I need to change them?

Any advise please,and thank you beforehand

Regards Dave M0GGK

Brian,

The cathode resistors usually "pop" because of a failure (the most common) of one, or both of the final tubes...for what ever reason. I would obtain KNOWN GOOD final tubes and check operation again after, you check what is stated below. Testing your 6146's whether they be A, B or W in a tubes tester will not guarantee they they will function correctly in the real RF environment.
If you are showing HV on the meter, that is usually accurate...but may be off a bit...you can test it at the "800" post on the rectifier board.
Since you indicate that you're trying to "bring it back to life," I guess that you do not really know the history of the rig? Check all voltages on the rectifier board...and the final board..."SG" & "FG" The "tune" function cuts HV to the finals during tune up..so the final do not operate at high voltage in an out of tune state. Switching to "CW" applies full HV. Also, check for proper orientation of the band switch position in relation to the "wafers" on the RF board and also S-22 which is in the final cage area for proper orientation. It is common for the band switch coupler...a white nylon round thingy at the end of the band switch shaft to be cracked/broken and get the switches out of wack.

I know some of the history of this rig, but not all of it. It was a rig that I found on ebay. When I received it, it was terribly out of tune and there was an issue with the bandswitch, both of these issues were resolved and I have used the radio off and on for the last six months with no problems.

I do not know exactly what he did with the bandswitch, but I know it was not the nylon coupler. While I had the tubes out I did take a look at it and I see no sign of breakage or slipping. I ordered a spare coupler from Ken just in case.

I would ask the tech what he did, but I have some trust issues. When I opened up the radio I found the w tubes that were in it when I bought it had been swapped out for b tubes.

I have an 820 with a good set of tubes I can try those and see how it behaves.

Thanks for the help

Robert,

C6 is the description of it on the schematic....25p more than likely indicates its value....25pf or "picofarrads."
It appears that it is NOT a polarized electrolytic...possibly a disc ceramic...other nomenclature I can not find
ie...voltage rating. You should be able to find a replacement at any decent electronics supply store...maybe even
Radio Shack. But, I would look at how it's connected and figure out why "the smoke got out." I'll look at the schematic
again later and see IF I can give you a better answer.

I would suspect that "the smoke got out" because you were trying to tune a G5RV Jr. on a band on which that antenna has a high VSWR. In spite of claims to the contrary, many antennas which are derived from the original G5RV antenna do not have a fairly low VSWR on all bands, and your combination of frequency, and tuner settings probably put a higher voltage on the cap than it was made for.

When replacing the 25pf cap, use the highest rated voltage device you can find, and use low power when attempting to tune for a match, next time. You might want to check to see what the actual VSWR of that antenna actually is at the frequency you are attempting to operate it at. I am betting it is through the roof!

I use a g5RV Jr antenna with my 830 and don't use a tuner.
I do use an antenna analiser to make sure the SWR is under 3:1 before I
try to tune the radio.
Thus far I have had less than 2:1 on all bands.

Brian,
Did you replace the 470 ohm resistor on the rect board? Also if you have no IP reading have a look at R15 56K on the rectifier board, I ususally replace r15 and r16 both are 56k. Have you checked on a watt meter if there is any output

Subject: [TS-520_820_530_830] Kenwood TS-830 no output.

Hello,

I have a TS-830 that I am trying to bring back to life and could use some advice. Here is what happened.

A couple weeks ago I was tuning up my 830, I had dipped the meter in "tune" mode and all looked good. I switched to CW and as soon as I hit transmit there was a soft POP and plate current dropped to zero.

I opened up the radio and found one of the cathode resistors was cracked. Using parts from K4EAA's website I replaced the the screen and cathode resistors. I put everything back together and still no output.

I do have HV according to the meter, but have not actually probed it.

I do see ALC output on the meter.

I still see no plate current.

I have made sure the SG switch on the back is on.

What should my next step be in troubleshooting this radio?

G'day

I would suggest having a look at the markings on the actual capacitor, I would assume that it would be an Type 1 RF type capacitor. Have a look at the attached link for an explanation on capacitor types. If you replace it with the incorrect type then you'll end up with trouble again. Spend the time in researching before putting just any type of cap in.

Also we are going to guess that the tunner was set up directly between the kenwood transmitter and the antenna and not behind a power amp. That tuner is only good for 200 watts.

Robert,

C6 is the description of it on the schematic....25p more than likely indicates its value....25pf or "picofarrads."
It appears that it is NOT a polarized electrolytic...possibly a disc ceramic...other nomenclature I can not find
ie...voltage rating. You should be able to find a replacement at any decent electronics supply store...maybe even
Radio Shack. But, I would look at how it's connected and figure out why "the smoke got out." I'll look at the schematic
again later and see IF I can give you a better answer.

I would suspect that "the smoke got out" because you were trying to tune a G5RV Jr. on a band on which that antenna has a high VSWR. In spite of claims to the contrary, many antennas which are derived from the original G5RV antenna do not have a fairly low VSWR on all bands, and your combination of frequency, and tuner settings probably put a higher voltage on the cap than it was made for.

When replacing the 25pf cap, use the highest rated voltage device you can find, and use low power when attempting to tune for a match, next time. You might want to check to see what the actual VSWR of that antenna actually is at the frequency you are attempting to operate it at. I am betting it is through the roof!

Topic: 40850 Message: 40850

Dear amigos of this list >
My more than thirty years old Kenwood TS820S is not working OK anymore.
The VFO frequency's behavior is really strange.
Let me explain what is happening so that maybe some of you may offer
advice about the possible cause and how to repair it.
I start up the rig on 40 meters and it will work OK up to about 7070
kiloHertz
receiving and transmitting, then I move up the VFO frequency to the national
Cuban net frequency of 7110 kiloHertz, and it receives OK there, but if
I push the PTT switch on the microphone, it stops receiving and only noise
comes out of the loudspeaker !!!
Then the mystery continues... I move down the VFO frequency to 7040
kiloHertz
and it again starts receiving OK.... then I move it up to 7110 kiloHertz and
it receives well, but if the PTT is actuated, once again the reception
and transmission
are totally lost and a wideband noise is all that is heard !!!
Will appreciate any advice on where to look for the problem...
AH, one additional data, the red LED marked VFO on the top of the front
panel
lights up intermittently and vanishes when the problem happens.

Thanks in advance for the help !!!

Arnie,

  Does this problem also happen on other bands when the VFO is tuned to about the same area or, just on 40m? Does this also happen if you are in "CW" mode and use the send/rcv switch to key the transmitter when the VFO is tuned to the same area?

   It may be as simple as cleaning the "wiper" on the inside of the VFO.

  I also do enjoy your show...when I can hear it....I have lots of QRN at times

Seeing it is across the transmitter input, and can see a hundred or more Watts of RF power, it would prudent to go with at least 600V or 1 kV rating for this capacitor.

C6 is on the output of the SWR bridge. It is the input capacitor of the matching network. It sees the full voltage of the transmitter output.

It is 25pf.

This is a 27pf 1000V capacitor:
598-CDV19EF270JO3F

You can buy it from Mouser. Buy several! If you have spares you probably will not need them.

The AT-200 uses 1300V tuning capacitors.

Hi Arnaldo

"AH, one additional data, the red LED marked VFO on the top of the front panel lights up intermittently and vanishes when the problem happens."

Loose VFO jumper plug on rear panel?
Also, give the VFO VC wiper a shot of Deoxit then run the VFO up and down a few times.
My 820 had same problem. Easily fixed.

40857. TS830S: intermittent shift in display and operation frequency

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-06 19:16:38 UTC
From: ravnpeter@ymail.com
Topic: 40857 Message: 40857

The procedure to fix intermittent shift in display and operating frequency on the TS830S is well described in the TS830S Survival Guide 6.6, but it doesn't tell how to lift the PCB on top of the sink so that you can insert a pair of tooth-lock washers between the heat sink and the PCB foil. I have removed the 5 screws holding the AFR/AVR unit, but can't swing the board over because of the transistors attached to the heatsink. Should I remove the screws holding them?
Any advice will be appreciated.
Thanks.
Peter, OZ8CTH

A lot of things will affect the VSWR on any antenna, not just a G5RV Jr. The height above ground, the proximity to various objects such as buildings, large signs, water towers, etc. etc. We do not know the particular case of our original posters setup, or exactly what frequency he was attempting to operate on when the cap blew. But I stand by my original post.

BTW, the thought about using RF graded caps is also a good one .

G'day,

Sorry I missed this post earlier first place to start is by removing the aux relay under VOX board and clean the contacts.

Robert,

Glad you found the link informative this is what the group was set up for, help one another and learn as you go, a great Ham put me onto that site and it has been a continual help and have given it to many people. Don't go less in volts going higher is better but try and stay at same voltage rating, the engineers at Kenwood designed the ATU and made allowences, I am a stuffed shirt about keeping same values and voltage rated components.

G'day

I would suggest having a look at the markings on the actual capacitor, I would assume that it would be an Type 1 RF type capacitor. Have a look at the attached link for an explanation on capacitor types. If you replace it with the incorrect type then you'll end up with trouble again. Spend the time in researching before putting just any type of cap in.

Hi,I recently purchased a Kenwood AT-200 and after setting up a new antenna (G5RV Jr) and tuning, I noticed smoke coming from the tuner. I opened it up and saw that a capacitor

(from the schematic, C6 25p) was fried. I would like some advice on what C6 25p actually means, where and how I can obtain a replacement. Here is the link to the Operating Manual which has a copy of the schematic.
http://www.kg6haf.com/downloads/AT-200_Manual.pdf.

40862. External digital readout for my 820

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-06 22:35:13 UTC
From: Jan Servaites
Topic: 40862 Message: 40862

Has anyone connect an external freq. readout to the 820? I see a good feasiblity to connect inside the Counter Ass'y Unit (x60-1020-001) using a frequency counter and do an off-set of 1mhz, and that it should read out the 820's freq correctly. Has anyone else seen that? I'll check that out this weekend when I have some time.
I expect a $40 freq counter kit would work just fine for an external readout and with a larger digits on a backlighted LCD.
Jan N8CBX

40863. Re: Kenwood tube education 1 of 4

Thank you Dave ! The Tube lessons explains a lot. I have forgotten almoust everything that I once learned about tubes.
Anode, Cathode grid and heater I know - but how they work and how tho dimension the components - that is al gone.

I am now rather sure that there is something wrong around the driver tube.
Last test in CW mode - measured 3W output at 14.2MHz and front the front instument measured:
HW 800
IP 120
ALC Zero
RF Zero.

I have ordered a set of tubes and also think that I will take the RF-bord out, clean it and check the caps around the driver tube and also check the band switch and Ohm-mesure the switch element.

73 /Roland

>
> Class of operation of our Kenwood driver tube and final tubes
>
> In our Kenwood hybrid rigs the Driver Stage and Final Stage tubes are biased to ensure Linear Operation so that we reproduce the SSB audio without distortion. By distortion we are not so much concerned about voice intelligibility as we are the generation of Intermodulation Distortion or IMD products. Although, severe distortion of the SSB envelope can result in a gravelly sound to the voice it is not a primary concern. The Human voice is composed of many tones. When the SSB envelope is distorted a great number of new frequencies are generated consisting of sum and difference frequencies of all the harmonics. These are spaced equal to the difference frequencies and extend outside the original channel width. The Tank circuit does a good job of attenuating

the even order products especially the 2nd harmonic, but does not adequately suppress the odd order products and the 3rd order is especially troublesome as it lies close to the operating frequency. If you look at the TS-830 transmitter specs you can see that the 3rd order suppression is > than -36dB. This means the 3rd order products are > -36dB below a single tone of a 2-tone test.
> In summary the Kenwood hybrid tubes are biased to permit linear operation and per the terms of our licenses we are required to operate the transmitter in a matter that does not result in IMD products that cause adjacent frequency interference ie splatter or buck-shot.
> The Class of an RF amplifier is defined by the degrees of conduction of Plate current flow in relation to the RF input sine wave cycle of the driving signal. Class A means Plate current flows for 360 degrees or 100% of the input RF sine wave cycle. Class A has a maximum theoretical efficiency of approx 50% and in practice 25% to 30% is attainable. We establish the Class of operation by setting the control grid or grid 1 negative dc bias voltage to produce a certain resting plate current on the load line. Some refer to this current as the "bias". This is not correct. Bias is not current it is voltage and with vacuum tubes normally a negative voltage is applied to a control grid nearest the cathode. We apply a negative voltage to the control grid to cut the tubes off in RX mode and a lower bias voltage level to turn them on to a certain current level (Class) in TX mode. The bias is the negative voltage level that produces this level of current. This resting current is called the quiescent current or Q-point.

40864. DG-5

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-06 22:56:22 UTC
From: Rick
Topic: 20533 Message: 40864

I just completed the task of insuring all of the plated through holes in my DG-5 are solidly connecting the two sides of the circuit board. I once again cleaned thoroughly the RCA connectors on the back of the DG-5 and on the adaptor unit I had to install on my TS-520. Unfortunately, I still get the exact same problem. The two decimal points appear in the "Display" screen but nothing more. I am getting the proper signals into the unit. I tested the input cables one at a time with the DG-5 counter which works flawlessly. I downloaded the service manual but it's not a real good copy and I'm not a real good digital tech. I would very much appreciate any suggestions, ideas or past experiences anyone might have.

Thanks and best 73,
Rick K5IAR

40866. TS-830 Weak Recieve but nice sounding

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-06 22:06:07 UTC
From: rolandver109
Topic: 40866 Message: 40866

Hi
My TS-830S sold to me as "for parts" are now partley up and running. Recieve is working and I am sure that I will get transmitt to work to after al hints I have got from members on this forum.

Recive is working on al bands but I experience the sound level, or RF-level a bit weak. The S-meter does´nt move a lot. Compared to a Peseus Reciever measuring "+10" on a signal , the TS-830S measures "7".(Same antenna). When puting in the RF level for "9" according to the service manual it measured "5".

is this normal for a TS-830? Is it out of aligment, or is there something wrong somwhere?

What suprised me is how good the TS830S sounds. The reciever noise is low and the soundon SSB is more pleasant than the Perseus SDR. Also, I can read weak signals almoust as good as the Perseus SDR with its DSP processing. Amazing - For the moment I prefer listen to SSB on the TS-830 trough its internal speaker than listen to the Perseus tough a pair of monitor speakers. Only think to remark on is that I here some hum when listening to very weak signals as I have to set AF to almoust100%.

73/Roland

40867. Re: TS-830S - 1W power out?

Many Thanks Joe

1 - Rely is cheked and cleaned OK

2 - The resistor in the DRV-line was a capacitor, I tought it was a VDR resistor first. It is (wrong?) connected to R38/L36 - i think the one who did this suspected that C29 was faulty but connected the new cap on the wrong side of R38.

3 - I think the finals is OK but something is wrong around the driver tube.

73/Roland

Roland,

Sounds like your on the way to having this radio working. I would perform the alignment procedure as per service manual, only thing is I clean the tip of my soldering iron before attempting to turn any of the slugs, using the clean hot iron tip place it on each slug and allow to heat momentarily, this can save headaches from splitting\cracking slugs. I have found that on all my hybird radios 28Mhz is a little selfish with S meter readings. It may also help to clean all the pots and swtiches on front panel with some de-oxit, mkaing sure to run the switch pot through its entire range a number of times, then give it a good blast of compressed air to clean out. Same with the band switch wafer, give them a good clean and then blast of compressed air. I'd do the cleaning first then the alignment procedure. Please keep us informed on how you go

Subject: [TS-520_820_530_830] TS-830 Weak Recieve but nice sounding

Hi
My TS-830S sold to me as "for parts" are now partley up and running. Recieve is working and I am sure that I will get transmitt to work to after al hints I have got from members on this forum.

Recive is working on al bands but I experience the sound level, or RF-level a bit weak. The S-meter does?nt move a lot. Compared to a Peseus Reciever measuring "+10" on a signal , the TS-830S measures "7".(Same antenna). When puting in the RF level for "9" according to the service manual it measured "5".

is this normal for a TS-830? Is it out of aligment, or is there something wrong somwhere?

What suprised me is how good the TS830S sounds. The reciever noise is low and the soundon SSB is more pleasant than the Perseus SDR. Also, I can read weak signals almoust as good as the Perseus SDR with its DSP processing. Amazing - For the moment I prefer listen to SSB on the TS-830 trough its internal speaker than listen to the Perseus tough a pair of monitor speakers. Only think to remark on is that I here some hum when listening to very weak signals as I have to set AF to almoust100%.

C6 is on the output of the SWR bridge. It is the input capacitor of the matching network. It sees the full voltage of the transmitter output.

It is 25pf.

This is a 27pf 1000V capacitor:
598-CDV19EF270JO3F

You can buy it from Mouser. Buy several! If you have spares you probably will not need them.

The AT-200 uses 1300V tuning capacitors.

G'day

I would suggest having a look at the markings on the actual capacitor, I would assume that it would be an Type 1 RF type capacitor. Have a look at the attached link for an explanation on capacitor types. If you replace it with the incorrect type then you'll end up with trouble again. Spend the time in researching before putting just any type of cap in.

Robert,

Glad you found the link informative this is what the group was set up for, help one another and learn as you go, a great Ham put me onto that site and it has been a continual help and have given it to many people. Don't go less in volts going higher is better but try and stay at same voltage rating, the engineers at Kenwood designed the ATU and made allowences, I am a stuffed shirt about keeping same values and voltage rated components.

Seeing it is across the transmitter input, and can see a hundred or more Watts of RF power, it would prudent to go with at least 600V or 1 kV rating for this capacitor.

Jim,

I agree with you 100%.
We had a GAP Eagle antenna attached to the side of the house, very close
to the shack, a few years ago.
Not only was SWR out of control, but we had RF dancing all over the shack.
We moved the antenna about 100 ft away from the shack to our barn and
not only was the RF issue gone but we got 1:2 SWR or better on all bands
the GAP is supposed to do. No tuner required.

With regards to our G5RV Jr, we have it up 45 ft or more and choke it
before it hits the ground.
We run about 150 ft of coax to get to the shack.
We're out in the woods, so nothing to cause much interference.
Again, we get 2:1 or less SWR on 40 to 6m and less than 3:1 on 160 and
80 on the G5RV Jr.

Topic: 40850 Message: 40876

Arnie:

As has been sugegsted, a dirty variable capacitor wiper or even something like a spiderweb in the VFO can cause such problems. I have found this is best fixed by removing the VFO, taking off the cover and cleaning and carefully lubing the tuning cap, paying special attention to the pivot points. You might get lucky if you spray a little lube such as LPS-1 in through the little hole in the top and work the knob back and forth.

Also, relative to the problem occurring when you hit the transmit button, it is common on the TS-820S for the carrier module to get off frequency. This will result in the signal disappearing or even shifting to a different frequency. You should consider doing alignment of the USB and LSB frequencies in that module.

Good luck!

Roland,

Glad I could help you out a bit. I saw that you intend to remove the RF board. Just make sure to make sure that when you put it back in all the wafers, shaft etc., are aligned correctly. If you have any question about that...I can help. Get a strong light and some magnification and take a good look on the foil side of the driver tube socket. I have seen many cracked solder joints here. Check also all the "molex" connectors on the foil side for dry/cracked solder joints...tough up any that appear questionable. I have been rather successful with cleaning the RF board in a soak of warm water and "DAWN" dish detergent and some light agitation with a long SOFT bristle brush....through rinse and complete drying. It really does work good

Many Thanks Joe

1 - Rely is cheked and cleaned OK

2 - The resistor in the DRV-line was a capacitor, I tought it was a VDR resistor first. It is (wrong?) connected to R38/L36 - i think the one who did this suspected that C29 was faulty but connected the new cap on the wrong side of R38.

3 - I think the finals is OK but something is wrong around the driver tube.

73/Roland

Roland,

  It is rather likely that at least a "basic" alignment stated in the "operators manual" is in order. If possible a full alignment. I can do most of the procedures
in the service manual except the "band pass filters" I do not have a sweep generator. There is a way to do this but I need to get full directions from another member.
He uses "spectrogram" and sound card and computer.

Subject: [TS-520_820_530_830] TS-830 Weak Recieve but nice sounding

Hi
My TS-830S sold to me as "for parts" are now partley up and running. Recieve is working and I am sure that I will get transmitt to work to after al hints I have got from members on this forum.

Recive is working on al bands but I experience the sound level, or RF-level a bit weak. The S-meter does´nt move a lot. Compared to a Peseus Reciever measuring "+10" on a signal , the TS-830S measures "7".(Same antenna). When puting in the RF level for "9" according to the service manual it measured "5".

is this normal for a TS-830? Is it out of aligment, or is there something wrong somwhere?

What suprised me is how good the TS830S sounds. The reciever noise is low and the soundon SSB is more pleasant than the Perseus SDR. Also, I can read weak signals almoust as good as the Perseus SDR with its DSP processing. Amazing - For the moment I prefer listen to SSB on the TS-830 trough its internal speaker than listen to the Perseus tough a pair of monitor speakers. Only think to remark on is that I here some hum when listening to very weak signals as I have to set AF to almoust100%.

Hi Rick,

I had a similar problem with a DG-5 I owned, and found it was due to a bridge between the traces on the circuit board. Check the board carefully, with a magnifying glass if possible, and look for any traces that have been bridged. Hope you can solve this problem. 73s, Scott, N6CIC

Thanks, Scott. It worked great about a year ago when I took the station down. When I put it back up a few days ago all worked well EXCEPT the DG-5 display. I normally use a round light with a large 3X magnifier in it, but I may go to an even stronger hand held magnifying glass to check for bridges.

I have just acquired this rig in what appears to be in near mint condition. This rig has not been powered up for 3-4 years.
Looking for the groups thoughts here. Replace the PS filter caps before power up? Anything else?

Also looking for a working DG-5 display for this rig.

All comments appreciated.

Power it up with and "autotransformer" OR VARIAC with a 100W incandesant light bulb (if you can still find one).... and slowly bring the ac voltage up to 120 V. The light bulb acts as a current limiting device. This will reform the electrolytic capacitors and save you a bunch of $ and labor. Nine times out of ten your caps will reform and be fine..... Why re-cap when you do not have to?

Roland: Make sure all your power supply voltages are correct. If I remember right, there is an AGC voltage adjust on the audio board that is critical for correct receiver sensitiviity and S-meter operation..... I wouldn't mess with any tuning until you verify correct voltages are present. 73's Dennis

Hi Robert,

Our antenna is the G5RV Jr from Radiowavz, we use it as a dipole.
My YL and I picked it up a couple of summers ago at HRO in New Hampshire
on sale for $25; we were very proud of each other, walked away from HRO
spending only $25!
It does not have a Ladder/Coax transition baun.
What we did do is choke it by making a coax loop four times around four
feet before the coax reaches the ground.
From there the coax runs into the basement, about 100 ft from the
antenna, and up to the shack which is in my home office; using another
50 ft of coax.

My YL and I were at a lighting store last week and they sold 100 watt incandescent light bulbs.
I questioned them about that and was told that Congress had put the legislature limiting wattage of incandescent light bulbs in the back burner!!!???
Anyway, I replied that Congress has no business telling me what I can or cannot do, especially in the light bulb department.

Without the ladderline and balun at the coax connection ,IT IS NO LONGER A G5RV ! Don't even call it that.
Now you have a single band dipole antenna resonant somewhat below the 60M band ! It would have unacceptable SWR on the other bands.
The choke wound in the middle of the coax line probably does nothing useful.
A better use of the dipole wire would be replace the coax with ladderline and run it directly to a balanced line tuner in the shack.

John,

OK, so you are saying the antenna Radiowavz sells as a G5RV Jr is not
G5RV Jr at all, no wonder it was only $25!
I just put my MFJ-259 analiser to the antenna here at the shack:

40M 2.0:1
30m 1.8:1
20m 2.2:1
17m 1.8:1
15m 1.8:1
12m 2.2:1
10m 1.5:1
6m 1.2:1

I tried just below 60m as well as 60m and got way over 3.0:1 by the way...

Above values make it possible to tune the TS-830 without using an
antenna tuner.

Yes, the numbers may not make sense, but there they are, and the antenna
works great!

You said you did not use the matching section of ladder line !
was this the case? If you retained the ladderline it IS a G5RV.
Low SWR may be due to your coax loss on the returned RF power.
 Still puzzling , if the flat top wire is actually 45 Ft long. I was way off.
The resonance is closer to 10.4 Mhz.
I lost your original posting but thought the length was given as 45 +/- feet.
I was thinking each HALF of the dipole was 45 ft. Not thinking clearly. sorry.
I am not sure of the length of a "Jr." antenna, the original G5RV was 3/2 wavelength Maybe 96-102 Ft long.

John,

Antenna does have 18 feet of ladder line and it measures 51 feet total.

40893. 6146W tube "cap" question

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-07 23:40:21 UTC

Topic: 40893 Message: 40893

Hi all,

A buddy of mine sent me some tubes. The cap (or nipple) of one of the 6146W tubes wiggles a little bit.

That CAN'T be good, can it? Meaning, is there any amount of wiggle that is OK? Or is it trash...

73,

Mark L. Hammond [N8MH]

Mark
It could be as simple as the fixing compound has just broken away. Personally any that I have received like that, including new ones I usually use for target practice at 300 metres. I have found in the past the wire usually breaks or the vaccum has been breeched.

Thanks, Dave. It does look like the black compound isn't intact around the cap. I think I'll follow your example!

I'm thinking that there might be something wrong with the existing tubes---last thing I need is to introduce another variable in the equation.

Mark,

When the cap cement has crystallized and disintegrated, it's almost always an indication that the tube has been way overheated.
Back in the late 60's, it was common to see the plate cap of the horizontal output tube of the larger screen color sets loose even
though the envelope was still intact and had a vacuum. In the worst cases, the envelope had been so hot that it was sucked in
and distorted. Lots of 6JE6 and 6JF6 outputs suffered that fate when the flyback or the damper shorted. I have a TS-520 sitting
downstairs right now that has one of it's 6146Bs sucked in. Both cathode resistors are shot and the plate choke is black. Some
rebuilding to do on this one before it is back on the air. I would assume that the outputs on your rig have been cherried up way too
much and the associated components should all be suspect now.

I have tried the radio with a known good set of tubes and still no current reading.

I do have a watt meter hooked up and see no rf output.

I did check the resistance across the 470 ohm resistor and my meter reads close enough that I did not replace it. I will need to check R15 and R16.

When checking the rectifier board what voltages should I be seeing on what pins? My volt meter tops out at 500v and I do not want to cook it on accident.

Thanks again and 73's,
KF5NOL

Hi Jack,

Thanks for the tips. I wasn't clear--the tube I was talking about is a New Old Stock 1987 era JAN GE 6146B that has apparently never been used---it didn't come out of my rig that way. Quite the opposite---I didn't want to put it in! hi hi

My rig has no visible evidence of abuse. The plate choke looks "shiny new" and while I did replace the four cathode resisors--they tested fine and looked OK. Precautionary, mostly...

Thanks,

Mark N8MH

Brian,

Your volt meter should be fine...just don't test the HV at the"800" post on the rectifier board. Most of the voltages are printed on the board itself...right by the pins. You can double check by looking at the "XRAY VIEW" of the rectifier board in the service manual. Use bright light. Note: some voltages are AC but most are DC. BE VERY CAREFUL, YOU WILL BE WITHIN 1/2" OR SO OF 800VDC....LETHAL....as in SK

I got a used tube that had that problem, and was able to basically just solder it back on. Just make sure the wire is still there and it hasn't lost it's vacuum. Be sure to put it into a tube tester before putting it in a radio, though.

Respectfully,

One more thing Rick. I am sure you have already done this, but re-check the connections from the input RCA jacks (Het, VFO, and Carrier) to make sure they are properly connected internally to the circuit board. In moving the unit perhaps an internal connection came loose. It has been some time since I worked on a DG-5, but that may be where I found either a bridge or a loose connection. Good luck with tracking down the problem.

Hi Cliff,

Wow, that's a neat fix. Mine seems connected (and could be tested for continuity) Sadly, I don't have a tube tester (Other than the rig,and it's not worth the risk..hi hi). It's the vacuum question I guess.

Hi members

Could someone confirm me if the information downunder is the correct one for construction of a TWIN interconnection cable ?

Here's the pin config (pin # on 1 end, destination on the other, or N/C (not connected)

Pin # - Destination
1 - 1
2 - N/C
3 - 3
4 - 4
5 - NC
6 - N/C
7 - 7 AND 16
8 - 8
9 - 9
10 - 10
11 - 11
12 - N/C
13 - N/C
14 - N/C
15 - 15
16 - 16 AND 7

Regards Jean ON4AEF.

My manual operator manual and service manual show this:

2,11 jumpered
4,5 jumpered
7 to receiver
16 to receiver

I can open up the cable later and verify if needed.

In that case, you can save it with some JB weld. Just make sure that the solder connection is good.

Hi Jack,

Thanks for the tips. I wasn't clear--the tube I was talking about is a New Old Stock 1987 era JAN GE 6146B that has apparently never been used---it didn't come out of my rig that way. Quite the opposite---I didn't want to put it in! hi hi

My rig has no visible evidence of abuse. The plate choke looks "shiny new" and while I did replace the four cathode resisors--they tested fine and looked OK. Precautionary, mostly...

Thanks,

Mark N8MH

40908. RE: [TS-520_820_530_830] Re: DG-5

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-08 13:44:00 UTC
From: Rick
Topic: 20533 Message: 40908

Thanks, Scott. I re-soldered each of the RCA jacks to be sure they were making good connection. It seems so strange to me that the "Counter" setting works perfectly and yet all I get are two decimals in the "Display" position. I assume this means the display portion is all working fine. I put that scope on each of the three connections (HET, CAR and VFO) and got waveforms for each. I'm not sure what I'm looking for so I don't know if they are the correct waveforms. As I move the scope through the circuitry using the Test Points (TP) I get pulses and various waveforms, so, I know something is getting through. However, not being well versed in digital equipment and not have a legible schematic (I have one on order) I'm not sure if what I am seeing on the scope is correct.

Thanks for your help and advice,..
73,
Rick / K5IAR

Subject: [TS-520_820_530_830] Re: DG-5

One more thing Rick. I am sure you have already done this, but re-check the connections from the input RCA jacks (Het, VFO, and Carrier) to make sure they are properly connected internally to the circuit board. In moving the unit perhaps an internal connection came loose. It has been some time since I worked on a DG-5, but that may be where I found either a bridge or a loose connection. Good luck with tracking down the problem.

40910. Transverter TV-502 pin cord

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-08 16:33:07 UTC
From: kd0fds
Topic: 40910 Message: 40910

I'm fianally getting around to building my transverter cables.
I have a question on the "pin cord."
My intent is to connect the TV-502 to my TS-820s.

According to the TS-820 manual:
"Connect the supplied pin-cords to the X VERTER OUT
jack of TS-820 and the TX IN jack of the transverter (2m
TX IN jack for TV-502)."

Can I use a high quality (monster) RCA cable for this "pin cord" or do I have to build my own with LRM400 or the like?

Thank you.

I have a pair of 6146W tubes in my other rig--a TS-520. Working great.

The files section of this Yahoo group have one or two documents that discuss the various flavors of 6146 tubes. It's a good read. My recollection is that the 6146W is a "ruggedized" version that would be better for mobile aps, military, etc. I also seem to recall that users can expect a little lower RF output from the "W" as compared to the "B."

If I remember right from the military days in the AF, the only difference between a regular and mil or ruggedized tube
was the filament current. We had people that used mil version tubes they scrounged from bench stock in their
Heathkits and the transformers ran hot because of the additional filament current.

I've been running W's in my most of my hybrids
and have had no problems with them nutrilizing.
I'm glad of that as I bought a dozen of them from RF parts at the time.

hi,

I got my tv-502 used and it had the tv-506
cable with it.

I just cut an old rca audio cable in half and
attached it to the pins on the connector.

works just fine.

hi

I also run 6146W NOS JAN by GE from
surplus sales.

My ts-530 with original tubes had one cap that
was a bit loose, used a little amount of
5 min epoxy to reattach it and no problems.

There was no solder on either cap on top of the tubes.

Likewise I have used B's and W's interchangeably in the TS-820S.
In the TS-520 I have used both 6146 and 6146A.

Hi Rick,
My SM-220 Book page 5 item # 6: For the TS-520 series specify the BS-5 Pan Display. If you don't have an Instruction Manual go on Line and Goggle Kenwood SM-220 Station Monitor. You will find all kinds of information.
Good Luck,
Wayne W6WMV Finley,Ca.

Thanks, Wayne. I was pretty sure the BS-8 would not work, but I was hoping there was some possible work around. Hopefully, I'll run a cross a BS-5 for sale or trade. This BS-8 does me no good at all.

Have a great weekend...

73,
Rick K5IAR

Thanks, James. I built the cable last night. Tests out perfectly, but no relays seem to click when I power up the tv-502.

My TV-502 likely has an internal fault waiting for me to find.

Hi Rick,
My SM-220 Book page 5 item # 6: For the TS-520 series specify the BS-5 Pan
Display. If you don't have an Instruction Manual go on Line and Goggle
Kenwood SM-220 Station Monitor. You will find all kinds of information.
Good Luck,
Wayne W6WMV Finley,Ca.

Date: Fri, 8 Feb 2013 16:40:59 -0600

I recently acquired a SM-220 station monitor with a BS-8 installed. Does
anyone know if it is possible to use this pan adapter on the TS-520 instead
of the BS-5?

Thanks.
Rick / K5IAR

The only thing different about the BS-5 and BS-8 is the first mixer stage. Everything after that is pretty much the same. Simple circuit to build; put a small toggle switch to switch betwen them and you have a BS-5/8. Add a switch to bypass the front end and now you have a SM-220 that works with a 455 KHz IF.

Hi Pete.

Thanks for the info. I hopefully have a BS-5 located I can swap my BS-8 for.
If that falls through I might just give the conversion a try.

The conversion looks easy enough as long as the CRT stays good. If it dies, you're dead in the water. No replacement CRT is available the last time I looked.

The CRT very rarely fails, what does fail is the HV PIO caps, have repaired and re-built several that have had no trace at all, easy and simple fix, as long as all the HV caps are replaced

I figured the CRT would be a bear to find if ever needed. This one is real bright and clear so far, but you never know. I was in the TV repair business years ago when they repaired them and I have a CRT Rejuvenator I guess I could whack it with. HI HI

Thanks again.

40936. Bandswitch again?

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-09 21:08:39 UTC
From: rolandver109
Topic: 40936 Message: 40936

Hi
Av re-assembled the bandswitch after taking it apart and checked every switch element.
But I a bit unsure if I got it correct assembled, could I have set the switches wring 180 deg. Wrong? Se picture for bandswitch set to 10MHz.
(Axel sides vertical, switch notch at 10 a clock)

Bandswitch

Roland,

It appears to me that the "wafers" are 180 degrees off. Look close at the white plastic of the wafers, you will see a small indented circle on each. Those should be to the nine(9) o'clock position, The "notches" should point slightly lower that the 3 o'clock position, the band switch know at the "10" position, flats of the shaft should be vertical, the shaft from S-22 in the final cage should show one "flat" down or 6 o'clock, the other should be at 3 o'clock or looking right back at you.
If not in the correct position, the receive side will not operate correctly, and you go to transmit...bad things can and will happen.

Subject: [TS-520_820_530_830] Bandswitch again?

Hi
Av re-assembled the bandswitch after taking it apart and checked every
switch element.
But I a bit unsure if I got it correct assembled, could I have set the
switches wring 180 deg. Wrong? Se picture for bandswitch set to 10MHz.
(Axel sides vertical, switch notch at 10 a clock)

40938. Why would this tube say "not Kenwood"?

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-10 00:10:40 UTC

Hi All,

I've been browsing around the web today looking at sources for 6146B and 6146W tubes.

At RF parts, they list a 6146W JAN GE tube that says, "not kenwood."

Any ideas why they would state that?? Link below...

I have a set that looks just like in my TS-520, and they seem to perform just great.

I have had the 520 for about two weeks now.
And I find when I first start up for the first time
The meter does not seem to be working properly
It won't register any strong signals or I can't get
Needle to move when I try to set the ALC.
after about 15 min if I durn the rf gain back and forth
Or switch band back and forth I can get the needle
To work any idea where I should start my search
To find the problem

I know there are some folks out there running the "W" version of the 6146 in their Kenwoods but remember that the only difference
between a "W" or Joint Army Navy (JAN) version and a regular tube is that the "W" tube is "Ruggedized" which means the filament
is beefier and thus pulls quite a bit more current than the regular 6146. It may be that they are warning Kenwood owners that the
transformer may not be up to the task. Just a maybe. As I said in an earlier post, there were several friends of mine in the AF that
used JAN bench stock tubes in their Heathkit ham gear and they eventually cooked the power transformers.

Over the years going to flea markets I've found three that were bad. Two had open filaments and the third had a neck crack in the area of the pin section. Vacuum was compromised. They were being sold for parts.

FYI: I found the following information on THeTubeStore.com regarding what they currently sell::

"Replaces 6146-A, 6146-B, and 6146W tube
types. The 6146W tube types produced after 1964 were designed to the
6146B tube specifications. Any 6146W tube produced before 1964 should
not be used in place of 6146B tube but can replace 6146A tube."

No extra information as to what the differences may be were provided on that site.

However, Surplus Sales of Nebraska states: "In most cases, our 6146W will directly replace 6146, 6146A and 6146B. Made for use in Collins and other U.S. manufactured equipment. Date code: 1987." So, they are specifying U.S. HAM manufacturers, and also show a date after 1964.

Hi Bob,

Yes, I've read a good bit about this before and after my post, including the various helpful files in the Files section of this group and the info you posted below. Thanks!

Our hybrid rigs would be considered "non-US manufactured," right?

I found the info at this link interesting, too:

Mark: Made in Japan!...Maybe Kenwood skimped on the filament part of the power transformer and only provided for the current of the specified tubes. In any case, we should all be aware of the potential for problems when substituting parts which aren't truly identical...

Since you have had this rig for a short time, I take it that you do not know the history. So, for starters, I recommend:

Obtain a good contact cleaner/lube. Everyone has their own recommendations....but I use "DEOXIT D5"
Obtain some "canned air." Also know as "air duster." Can be found at/in computer shops/areas of stores dealing with electronics. Walmart & Costco are two.
With power OFF..rig UNPLUGGED...follow directions on the DEOXIT can. Exercise switch/control numerous times...blow "canned air" into/or on control.
I do mean, every control that rotates, slides, or otherwise moves. Blow off with "canned air."
Let rig sit for a short time...maybe 15-30 minutes..to make sure that all of the DEOXIT is evaporated...as it is flammable.
Power on rig, check for proper operation.

I have been surprised by how many problems have been "fixed" by a good cleaning of controls. These rigs are old...and will develop control problems, especially when left to sit...or even when operated, controls...etc..left in the same place. Check tightness of screws that hold down the various boards too!

Subject: [TS-520_820_530_830] The meter not working properly

I have had the 520 for about two weeks now.
And I find when I first start up for the first time
The meter does not seem to be working properly
It won't register any strong signals or I can't get
Needle to move when I try to set the ALC.
after about 15 min if I durn the rf gain back and forth
Or switch band back and forth I can get the needle
To work any idea where I should start my search
To find the problem

40947. KENWOOD HYBRID USER NET (January 17th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-10 19:15:26 UTC
From: mvgilger
Topic: 40947 Message: 40947

The Saturday's net on 40 meter we had 30 stations checking with good band conditions. Out of those, there was:

7 running TS-520(x)
3 running TS-530(x)
5 running TS-820(x)
6 running TS-830S

I was running a TS940. The rest were running non hybrids of one model or another.

The Sunday 20 meter net we had 17 stations checking in under good band conditions. Out of those, there were:

5 running TS-520(x)
1 running TS-530(x)
2 running TS-820(x)
3 running TS-830S

I was running a non hybrid TS-940. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 93, Sunday's total = 87
February 2013, Saturday's net total = 54, Sundays total = 44. (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

40949. Re: TS-830S - 1W power out?

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-10 20:59:36 UTC
From: rolandver109
Topic: 40802 Message: 40949

Hi
I have now serviced the band switch (by disassembling it and testing every switch element). Driver tube socket re-soldered. Caps C29 and C69 checked. All resistors on the final unit board checked. After assembling everything and checked band switch alignment (twice) - power output is better but are still is low.
Meter reads in tune mode and CAR 50%: ALZ = "0", IP=80mA, HV=800. Power measured to maximum 5W at 14.2MHz against a 50 Ohm dummy load.
Anyone who have some hints what to check next?
73´s/Roland

>
> Roland,
>
> Â Â Glad I could help you out a bit. I saw that you intend to remove the RF board. Just make sure to make sure that when you put it back inÂ all the wafers, shaft etc., are aligned correctly. If you have any question about that...I can help. Get a strong light and some magnification and take a good look on the foil side of the driver tube socket. I have seen many cracked solder joints here. Check also all the "molex" connectors on the foil side for dry/cracked solder joints...tough up any that appear questionable. I have been rather successful with cleaning the RF board in a soak of warm water and "DAWN" dish detergent and some light agitation with a long SOFT bristle brush....through rinse and complete drying. It really does work good

40950. 30M WARC mod for TS-820S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-10 21:36:29 UTC
From: jazzguitarboy605
Topic: 40950 Message: 40950

Hi all,

I did the majority of the 30M WARC mod for the TS-820S on my radio and documented it as I went. I have receive on 30M working great, and the new driver coil for transmit installed, but I wasn't able to complete the transmit part of the mod because I don't have tools (or hands) small enough to manipulate some of the wires to the loading capacitor without breaking something.

I put some info and a couple of photos in the mods folder in the files section here.

If anyone else is interested in attempting this mod, I have five extra 15.500 MHz crystals and one extra slug-tuned coil -- shoot me an email.

73,
Ben (AK4YG)

hi,

Did the Heathkit gear use the tubes
in push pull or parallel circuit?

I am trying to hook up a Turner Super Sidekick mic to my TS-520S. I've got it working in the VOX mode. But I want to be able to use it in push to talk mode as well. Can it be done? Does anyone have the wiring info they can pass along to me?

Paul,

Look at this site:

http://www.cbtricks.com/mic_manuals/turner/turner_super_sidekick_om.pdf

I would put the switch in the "relay" position and use that diagram.

hi,

Did the Heathkit gear use the tubes
in push pull or parallel circuit?

All the Heathkit HF units wit dual 6146s were parallel. There were VHF units that had PP 6146s.

Roland,

Have you looked at doing a check of the TX(transmit) section shown on Pg 44 of the service manual?

I'm going to be gone for a couple of days...I won't have computer access where I'm at

Subject: [TS-520_820_530_830] Re: TS-830S - 1W power out?

Hi
I have now serviced the band switch (by disassembling it and testing every switch element). Driver tube socket re-soldered. Caps C29 and C69 checked. All resistors on the final unit board checked. After assembling everything and checked band switch alignment (twice) - power output is better but are still is low.
Meter reads in tune mode and CAR 50%: ALZ = "0", IP=80mA, HV=800. Power measured to maximum 5W at 14.2MHz against a 50 Ohm dummy load.
Anyone who have some hints what to check next?

HI all
i was tuning up on my kenwood ts 520 on 10m the other day then the 4 a fuse went.

after i changed that i noticed the power out has gone really down like 30 watts on 80 m and same really across all the bands. i did notice that the power was going down slowly before this.

i was wondering as the valves or tubes have never been changed in this rig since it was built in 1980 are they ready for a change and how do i do it?

thanks before hand

best 73 Dave M0GGK

Roland,

I dug through some info you might find useful regarding the 830 you are dealing with:

Voltage measurements on the "final board:"

volts are DC unless noted
Rig in XMIT(transmit), 14.20Mhz, HV= 800, Ip= 230mA, @ 100W output into 50 ohm dummy load

6146B P-1, 4 , 6 = 1.5vdc
P-2 = 0vdc/12.6vac(heater)
P-3 = 228vdc
P-5 = -68.2vdc
P-7 = 0vdc/6.0vac (heater)
P-8 = 0vdc/0vac

"SG" post should be same as P-3

"FG" post should be same as P-3

Voltages may not be what you observe...but should be CLOSE.

I'll be QRT for a couple

Roland,

  I sent 1 piece of incorrect info:

              correct below to read: "SG" should be same as P-5

73 Joe

Subject: Re: [TS-520_820_530_830] Re: TS-830S - 1W power out?

Roland,

   I dug through some info you might find useful regarding the 830 you are dealing with:

   Voltage measurements on the "final board:"

     volts are DC unless noted
    Rig in XMIT(transmit), 14.20Mhz, HV= 800, Ip= 230mA, @ 100W output into 50 ohm dummy load

                                        6146B P-1, 4 , 6 = 1.5vdc
                                                  P-2 = 0vdc/12.6vac(heater)
                                                  P-3 = 228vdc
                                                  P-5 = -68.2vdc
                                                  P-7 = 0vdc/6.0vac (heater)
                                                  P-8 = 0vdc/0vac

                                             "SG" post should be same as P-3

                                             "FG" post should be same as P-3

     Voltages may not be what you observe...but should be CLOSE.

     I'll be QRT for a couple

73 Joe

Subject: [TS-520_820_530_830] Re: TS-830S - 1W power out?

Hi
I have now serviced the band switch (by disassembling it and testing every switch element). Driver tube socket re-soldered. Caps C29 and C69 checked. All resistors on the final unit board checked. After assembling everything and checked band switch alignment (twice) - power output is better but are still is low.
Meter reads in tune mode and CAR 50%: ALZ = "0", IP=80mA, HV=800. Power measured to maximum 5W at 14.2MHz against a 50 Ohm dummy load.
Anyone who have some hints what to check next?
73´s/Roland

> Â Â Glad I could help you out a bit. I saw that you intend to remove the RF board. Just make sure to make sure that when you put it back inÂ all the wafers, shaft etc., are aligned correctly. If you have any question about that...I can help. Get a strong light and some magnification and take a good look on the foil side of the driver tube socket. I have seen many cracked solder joints here. Check also all the "molex" connectors on the foil side for dry/cracked solder joints...tough up any that appear questionable. I have been rather successful with cleaning the RF board in a soak of warm water and "DAWN" dish detergent and some light agitation with a long SOFT bristle brush....through rinse and complete drying. It really does work good

Roland:

Let's try this ONE LAST TIME: "FG" same as P-5

Roland,

I sent 1 piece of incorrect info:

correct below to read: "SG" should be same as P-5

73 Joe
WB7UQU

Subject: Re: [TS-520_820_530_830] Re: TS-830S - 1W power out?

Roland,

I dug through some info you might find useful regarding the 830 you are dealing with:

Voltage measurements on the "final board:"

volts are DC unless noted
Rig in XMIT(transmit), 14.20Mhz, HV= 800, Ip= 230mA, @ 100W output into 50 ohm dummy load

6146B P-1, 4 , 6 = 1.5vdc
P-2 = 0vdc/12.6vac(heater)
P-3 = 228vdc
P-5 = -68.2vdc
P-7 = 0vdc/6.0vac (heater)
P-8 = 0vdc/0vac

"SG" post should be same as P-3

"FG" post should be same as P-3

Voltages may not be what you observe...but should be CLOSE.

I'll be QRT for a couple

Subject: [TS-520_820_530_830] Re: TS-830S - 1W power out?

Hi
I have now serviced the band switch (by disassembling it and testing every switch element). Driver tube socket re-soldered. Caps C29 and C69 checked. All resistors on the final unit board checked. After assembling everything and checked band switch alignment (twice) - power output is better but are still is low.
Meter reads in tune mode and CAR 50%: ALZ = "0", IP=80mA, HV=800. Power measured to maximum 5W at 14.2MHz against a 50 Ohm dummy load.
Anyone who have some hints what to check next?
73´s/Roland

> Â Â Glad I could help you out a bit. I saw that you intend to remove the RF board. Just make sure to make sure that when you put it back inÂ all the wafers, shaft etc., are aligned correctly. If you have any question about that...I can help. Get a strong light and some magnification and take a good look on the foil side of the driver tube socket. I have seen many cracked solder joints here. Check also all the "molex" connectors on the foil side for dry/cracked solder joints...tough up any that appear questionable. I have been rather successful with cleaning the RF board in a soak of warm water and "DAWN" dish detergent and some light agitation with a long SOFT bristle brush....through rinse and complete drying. It really does work good

40961. my first TS-520

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 40961 Message: 40961

Hi all,

A week ago I was given my first TS-520. It spent about 30 years in the cabin of a sailboat. Yes, the cabinet has rust and needs repainting but the insides were remarkably clean. There were some issues on the RF board which I have repaired. The receiver seems to work well. The xmtr is working but only getting about 75W out on 20m and 100W out on 40m.

While looking at the RF board I found that a 33K resistor was wired in series with a rectifier diode, D6. Anyone know if this is a factory change or is a widely known mod?

The s-meter is not currently working on receive. The meter movement does work. When I looked at the IF board I noticed a terminal strip mounted mounted to the top of the IF board using the mounting screw of the IF board. It is located at the outside edge, in the center, next to the location for a CW filter. Is this also something from the factory or is it an end-user mod?

Thanks and 73,

Bill

Roland,
Assuming that the driver tube and the finals are OK, I would suggest that you check Rf voltages according to the Transmit Rf level diagram on page 44 of the service manual. This may give you an indication as to why you are not getting drive (since your ALC reading in Tune mode seems to be zero). Most of these measurements are done with the SG switch OFF so as not to stress the final tubes.
You will need to use an Rf probe and a digital multimeter or VTVM. I made my own Rf probe from two 1N60 diodes in series, a 0.01 uf ceramic cap (500 volts or more), and 4.7 megohm resistor, according to circuit diagrams in the ARRL handbook or on the internet.

On the Rf board you would first measure the Rf voltage at TP-4 which should be around 2.0 Rf volts. You should also measure the VCO voltage at TP-3 which should be around 1.0 Rf volts. I suggest doing these measurements at 14.175 MHz. If both of these voltage readings are OK, then you know that the mixer should be providing sufficient Rf drive to the driver tube. If these voltages are very much lower than there may be a problem on the IF board or even on the PLL board.

If you are getting the correct voltages at TP-4 and TP-3, then the next item to check is the Rf drive on pin 7 (the plate) of the driver tube. This requires a device called a Pomona socket, which can be found on eBay. With the Pomona socket in place you can also check that you have the correct DC voltages to pins 7, 8, and 2 to make sure they are within spec. CAUTION-the EXPOSED PINS ON THE POMONA SOCKET WILL HAVE HIGH VOLTAGES (Pin 7 about 330 volts). Rf drive to pin 7 should be about 75 Rf volts, but I have found it to be somewhat lower and I still can get 100 watts output from the rig.

For each measurment, be sure to record the positions of the Drive and Carrier controls. You will need these for future reference.

I hope this will be a good start in your analysis of the low output problem you are having. Terry Wagner first gave me the advice to do the above, and I was able to correct problems with my TS-830S.

Hi All,

I recently picked up a TS520S and a D104 without a PTT. Its in excellent shape, however, I don't think I will use it.

I would rather use a MC-50 or compatible matching mic for the rig.

If anyone is interested and would like to trade for TS520S related gear....let me know.

I haven't tested the D104, but there's not much that can go wrong with all that very shiny chrome :-)

Thanks
Archie

40967. REÑ TS820S out of frequency lock

From: Prof. Arnaldo Coro Antich
Topic: 40967 Message: 40967

Any ideas what may be the cause of the sudden loss of frequency lock
after pressing
the PTT ?
The radio receives OK up to a certain frequency... sometimes it allows
one to transmit
on frequencies below about 7060 kHz, other times it doesn't.
Moving up to 7110 it ALWAYS looses both reception and transmission after
pressing
the PTT .
Power output is normal when it works...
Tested the external VFO and the problem is identical with both VFO's
Any ideas of how to reach the possible affected part of the rig ?
Thanks for help... it is my only HF multiband rig !!!

More than likely your VFO needs to have the Rear
Wiper tab cleaned. The procedures is located at:

http://www.n6wk.com/kenwood/TS-820-VFO--servicing.pdf

In most cases you do not need to remove the vfo
to perform. Just remove the rear most screw on
the side plate access plate and spray a few drops of DeOxit on the tab.

Good luck.

Mark

G'day Tim,

Seems you have answered your own question. It appears to be a loose or bad connection with a molex connector or dry\cold joint. Look at the circuit diagram for the (S13) IP section of the switch and trace back, then go to that connector(s) and removed, clean and refit, if it continutes to happend remove the affected board, look at the foil side of the board under magnification and good lighting and remove old solder sand and clean and re-apply new solder. Clean S13 using deoxit, ensuring switch is run through its entire range multiply times, dry off using can/compressed air then allow to dry for a further 30 minutes just to be on safe side. Dont for get that these radios have HV that can kill, when poking around inside disconnect from power supply and discharge HV system several times.

When requesting help, please include callsign and name at bottom of email.

Amigo Arnie,

I suspect that if cleaning the VFO "wipers" on both the rig and remote does not solve the problem...I would take a look at the service manual and check the voltages on the VCO(voltage controlled oscillator) according to the procedure on Pg 45, Section 2-2, and Pg 52 & 53, section 5-2.

DEOXIT is a commonly available cleaner/lube here in the USA. It may not be available to you locally. Any old "TV" channel selector cleaner/lube should serve as well.

Buenos Dias Arnie,

Right, WD40 must be flushed out!

I remember back in the mid 70s I bought a Peugeot racing bicycle.
The dealer told me to never use WD40 on the chain as it will "eat it up"
and also void the warranty.
I never used WD40 after that on anything!

Thank you very much amigo Dennis !!!
II am sure that Pedro my chemical engineer friend can ? duplicate? the
formula
and make a list a pint for me !!!
It was very easy to download the detailed and fully illustrated procedure to
open up the rig and partially dismount the internal VFO in order to apply
the Deoxit to the back wiper and also lubrication to the ball bearing
at the front of the capacitor.
I will perform this maintenance anyway, despite the fact that it looks
like the problem
is in the complex VCO PLL circuits !!!
Otherwise this TS820S is cosmetically in a like new condition, and it
was working
nicely until the failure that unlocks the VCO developed, possibly to be
blamed
on ageing electrolytic capacitors ...

73 and DX
Arnie Coro

Hi Wayne,

Yes, I'm a member of two Yahoo TS-2000 groups--just search for them. I haven't been receiving daily emails for quite a while from that group (my choice), but I remain a member.

There has been some great discussion from time to time, but it's not NEARLY as warm and helpful as this Hybrid group :) My opinion of course...but it's also a fact..hi hi.

Lots of info in their archives as well.

Aha! The mineral oil explains a lot.

When I made my first application of Deoxit spray (5%) to a TS-520, I treated it like it would ALL evaporate, like electrical connection cleaner that is all volatile and leaves no residue. That was a mistake on my part...and a bit messy.

Quickly it became obvious that only small amounts are needed, and that it WILL leave an oily residue where you overspray/drip. I started using paper towels to catch such things during spraying/dripping.

Maybe my mistakes will spare somebody else who is new to the concoction.

Subject: [TS-520_820_530_830] my first TS-520

Hi all,

A week ago I was given my first TS-520. It spent about 30 years in the cabin of a sailboat. Yes, the cabinet has rust and needs repainting but the insides were remarkably clean. There were some issues on the RF board which I have repaired. The receiver seems to work well. The xmtr is working but only getting about 75W out on 20m and 100W out on 40m.

While looking at the RF board I found that a 33K resistor was wired in series with a rectifier diode, D6. Anyone know if this is a factory change or is a widely known mod?

The s-meter is not currently working on receive. The meter movement does work. When I looked at the IF board I noticed a terminal strip mounted mounted to the top of the IF board using the mounting screw of the IF board. It is located at the outside edge, in the center, next to the location for a CW filter. Is this also something from the factory or is it an end-user mod?

Thanks and 73,

Bill

Topic: 40961 Message: 40985

Hi Prem,

I've seen a photo of another RF board and it has the same modification to diode D6, a ressitor in series with D6. For now, I will assume this was a factory mod.

I traced one of the wires from the terminal strip and found it was the red wire to the VFO. Mike, W5RKL, has told me that this is the RIT line to the VFO. I will trace this back to its origin and see whats up. The RIT function is working on the radio.

I found that the reference voltage, RF1, on the AVR board was sitting at 2.6V. Pin 9 of the board was at 9V. I adjusted VR3 to set RF1 to 3.3V. Signal levels came up and I could zero the s-meter. However, I could only get the s-meter to S7 by adjusting VR2 on the IF board. I'm using a Heathkit IG-42 generator which has a built in signal level meter but I haven't checked that for accuracy of the output. Other than the sensitivity of the s-meter perhaps being off the s-meter now functions on all bands.

Since this email goes to the forum, google tells me that a replacment for the 3SK41 etc FETs is an NTE-222 or an RCA 40673. Is one any better of a choice than the other?

Thanks to all & 73 - Bill

Hi Bill,

It has been a while since I probed the innards of my TS-520. Perhaps the others with recent hands-on experience can chip in.
I can send you some pics of the boards and wiring you are referring to - if that's of any help.
BTW, is your AGC switch on ? And, is your RF gain fully CW ?

On one of my TS-520 the front-end MOSFET was noisy. I replaced it with a BF-966 from my junk box. Had no reason to hunt for any other equivalent. The 40673 is also a hard-to-find transistor....

73,
Prem.

Hi Prem,

I've seen a photo of another RF board and it has the same modification to diode D6, a ressitor in series with D6. For now, I will assume this was a factory mod.

I traced one of the wires from the terminal strip and found it was the red wire to the VFO. Mike, W5RKL, has told me that this is the RIT line to the VFO. I will trace this back to its origin and see whats up. The RIT function is working on the radio.

I found that the reference voltage, RF1, on the AVR board was sitting at 2.6V. Pin 9 of the board was at 9V. I adjusted VR3 to set RF1 to 3.3V. Signal levels came up and I could zero the s-meter. However, I could only get the s-meter to S7 by adjusting VR2 on the IF board. I'm using a Heathkit IG-42 generator which has a built in signal level meter but I haven't checked that for accuracy of the output. Other than the sensitivity of the s-meter perhaps being off the s-meter now functions on all bands.

Since this email goes to the forum, google tells me that a replacment for the 3SK41 etc FETs is an NTE-222 or an RCA 40673. Is one any better of a choice than the other?

Thanks to all & 73 - Bill

Hello Bill,

RE: S meter.
Is the AGC switch ON (fast/slow) ? I'm assuming you have the RF gain turned all the way CW.

The TS-520 is a work-horse. Great audio on TX. Congratulations on your new acquisition !

73,
Prem.

Subject: [TS-520_820_530_830] my first TS-520

Hi all,

A week ago I was given my first TS-520. It spent about 30 years in the cabin of a sailboat. Yes, the cabinet has rust and needs repainting but the insides were remarkably clean. There were some issues on the RF board which I have repaired. The receiver seems to work well. The xmtr is working but only getting about 75W out on 20m and 100W out on 40m.

While looking at the RF board I found that a 33K resistor was wired in series with a rectifier diode, D6. Anyone know if this is a factory change or is a widely known mod?

The s-meter is not currently working on receive. The meter movement does work. When I looked at the IF board I noticed a terminal strip mounted mounted to the top of the IF board using the mounting screw of the IF board. It is located at the outside edge, in the center, next to the location for a CW filter. Is this also something from the factory or is it an end-user mod?

Thanks and 73,

Bill

Hi Prem,

No need for pix yet. You could tell me if D6 your RF board has a mod. Where the diode should go through the two holes the diode is in series with a resistor. Is your the same? D6 is located along the left side of the board about 1/3 of the way front the front of the rig.

Yes, AGC is on and RF gain turned up all of the way. This might sort itself out after I do an alignment.

Remove all the solder from the old cap, and use a SMALL ammount of high temperature silicone automotive exhaust manafold gasket sealer to glue the cap back on. After the silicone has CURED, solder the cap connection. The cap will stay in place!

Hi Cliff,

Wow, that's a neat fix. Mine seems connected (and could be tested for continuity) Sadly, I don't have a tube tester (Other than the rig,and it's not worth the risk..hi hi). It's the vacuum question I guess.

40991. Best grease for Kenwoods

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-14 15:51:28 UTC
From: John Donnelly
Topic: 40991 Message: 40991

Hi All,

I've got a TS-520 that I'm trying to get back on the air. It was sitting in the humid Florida environment for quite some
time, I suspect maybe in a garage, because it was loaded with dust, greasy film and palmetto bugs. I've washed it out
with some CRC electronics cleaner, blown it out with the compressor and air chuck and the chassis and boards look
pretty good now. The receiver seems to beworking pretty well and the VFO dial is dead on frequency.

I've lubed the controls andband switches with deoxit gold but I'm not sure what to use for the tuning caps and other lube
points. What's theconsensus on the best grease and where can I get it? Next step is to rebuild the RF cage and power
supply with partsthat are in the mail. Can't believe it, but I had to break down and buy a Weller soldering gun. My 15 watt
pencil iron that I've been using all these years somehow won't heat those chassis fangs to get the cathode resistors off.

;-)

Thanks,

Jack   KV4JX

Jack,
Using Deoxit Gold on non-gold contacts may a bad idea, like using grease on cap's.
Deoxit D5 is a recommended cleaner of contacts and variable cap wipers.
There have been reported issues with CRC cleaner on plastic parts.
See previous posts on the subject.

Jack:

Yes, I live in Florida, too, and I know how it can be. And while CRC makes some great electronics cleaners, including some designed for a marine environment, DO NOT use CRC Electro cleaner! I have a ruined DX-150A and a messed up dial on a Heathkit GDO from using that Electro cleaner. It was fine on WWII vintage gear but some of the plastics that came out in the mid-60's just melt when it hits them - and I am talking about visable vapors being produced!

For lubing pots and switches I recomemnd LPS-1, which is a lightweight lube that I have used for over 30 years. I get mine at Ace Hardware. It works wonders on scratchy volume control pots - it does not fix them permanently, but lasts quite a while before you have to reapply it. I saved myself over $600 by using LPS-1 to fix an erratic mass airflow sensor on a Toyota truck. The pot on the sensor went from jitter-jitter acorss most of the range to smooth with just one little bump after I applied the LPS-1

I understand that LPS-1 is sometimes found at bike and motorcycle shops because it is one of the very few things that will lube a chain and not encourage more dirt to collect on it.

I am rebuilding a TS-520 right now. It has some severe power supply problems (as in smoke!) and I am replacing just about everything in that circuit but the transformer. I was sure the 500V 100 uf caps were shot but after I got them out it they seem to test good. I'll replace all the HV caps anyway; and I'm rolling my own for that rather than buying the kits.

Good luck!

Robert
WB5WSV

40994. 2M emergency J-pole

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-14 20:01:06 UTC

Topic: 40994 Message: 40994

Good afternoon, just thought I would pass this special offer along from
Amateur Radio Suppllies on everything you need to build a 2M roll-up jpole.
You can hang it from your ceiling and have instant communications into your
local repeater, or if you have antenna restrictions this is the antenna to
go with.

Now is the time to build that first 2M emergency j-pole, and you can get
everything you need for under 10 bucks and build it yourself over at
Amateur Radio Supplies.

Robert,

Would you use the LPS-1 on the capacitor shaft and through the chassis bearings?

Jack:

Yes, I live in Florida, too, and I know how it can be. And while CRC makes some great electronics cleaners, including some designed for a marine environment, DO NOT use CRC Electro cleaner! I have a ruined DX-150A and a messed up dial on a Heathkit GDO from using that Electro cleaner. It was fine on WWII vintage gear but some of the plastics that came out in the mid-60's just melt when it hits them - and I am talking about visable vapors being produced!

For lubing pots and switches I recomemnd LPS-1, which is a lightweight lube that I have used for over 30 years. I get mine at Ace Hardware. It works wonders on scratchy volume control pots - it does not fix them permanently, but lasts quite a while before you have to reapply it. I saved myself over $600 by using LPS-1 to fix an erratic mass airflow sensor on a Toyota truck. The pot on the sensor went from jitter-jitter acorss most of the range to smooth with just one little bump after I applied the LPS-1

I understand that LPS-1 is sometimes found at bike and motorcycle shops because it is one of the very few things that will lube a chain and not encourage more dirt to collect on it.

I am rebuilding a TS-520 right now. It has some severe power supply problems (as in smoke!) and I am replacing just about everything in that circuit but the transformer. I was sure the 500V 100 uf caps were shot but after I got them out it they seem to test good. I'll replace all the HV caps anyway; and I'm rolling my own for that rather than buying the kits.

Good luck!

Robert

Robert,

My TS-520 had power supply problems as well but not catastrophic like you seem to have. Some diode problems
and just old dried out electrolytics on mine. It was blowing fuses until I replaced the diodes in the 13.8v supply.
Someone really fried the RF though. One of the 6146Bs got so hot that it sucked in the envelope on one side. The
choke, the RF caps and the cathode resistors are suffering from the current and heat as well so they have to be replaced.

Jack:

Yes I would. And I did. When my TS-820S had a serious VFO problem, with the frequency jumping 500 KHZ, even out of the band at varios spots, I took the VFO out, removed the cover, cleaned it with electronic spray cleaner and then lubed it with LPS-1. Problem solved. Other controls and switches got similar treatment.

I do need to take the bottom cover off my currently operating TS-520 and clean and lube the WWV switch. If you push it in it just right and then back out then the switch does not make proper contact and the received signal level drops way doan.

Topic: 40991 Message: 40998

Well, on this latest one I am working on the 6146's are gone, as is the cover over that section. I'll have to make a new cover out of aluminum plate. The cover over the relay on the bottom is gone as well, and the 12BY7A is missing. Other than the power supply damage everything looks pretty good.

A former owner went through it and cut the wires to the power supply section, apparently as part of an attempt to isolate the problem. He tacked in temporary extra wire lengths as part of that. I have been going through the schematic and tracing wires to make sure they go where they are supposed to.

I had bought an extra rectifer board a while back and put new caps in it and used it to replace the board that was smoking.

And I replaced all of the resistors on the HV board. By the way, since Radio Shack did not have them I ordered 100 of each, so if you need any I have them. I may make up little packets of them and sell them.

I made up a new filter cap assembly today using a piece of RS perfboard, four 68uf 500V caps I got pretty cheap a while back (like $1.50 each), and a hunk of 1/4 in phenolic I salvaged out of an old aircraft autopilot. I will do the same for the 22uf HV caps under the chassis on the left bottom side.

Already having a TS-520 and an TS-820S, both of which I had to repair (the 820S was a real bear), I need another one like I need another cranial orifice, but it's fun!

And one of these will go to my brother in Augusta, GA who I am encouraging to get his ham license.

Never mind the post looking like SPAM...the product described no longer exists.

Although...it would be nice to have an emergency 2-meter antenna if somehow my TS-520 was able to reach 2 meters on its own...

Dave,

I just checked the label on the can of CRC I used and it doesn't contain and chlorides any more which were deadly on plastic.
Their chemistry used to be mainly trichloroethylene but now it is hexane isomer based. It didn't hurt anything on the TS-520
and did an excellent job stripping the years of grease, dirt and insect parts off the boards and left the chassis nice and clean.

I'm wondering if people experienced problems with the QD cleaner or the older CRC.

Thanks for the tip.

Jack,
Using Deoxit Gold on non-gold contacts may a bad idea, like using grease on cap's.
Deoxit D5 is a recommended cleaner of contacts and variable cap wipers.
There have been reported issues with CRC cleaner on plastic parts.
See previous posts on the subject.

The product exists....the link was bad.....simply go to the "Basic" web site and then click on VHF/UHF.

It is listed for sale....

Hi all,
How do I change the 12BY7A driver valve cover? Does it just slip off or is there a technique do this?

Any help advise many thanks beforehand

Regards Dave M0GGK

The RF shield is wrapped in a clockwise direction. The easiest way to remove it is to pull the 12BY7 out of it's socket
with the shield on it then push the tube out of the shield while prying it open gently. It comes out pretty easily. Replacing
it is easy as well. Make sure you have the larger opening down and press it over the installed tube.

Topic: 41008 Message: 41008

Hello Group,

I notice while checking the different bands on my TS-520 that there are numerous Birdies in the receiving mode. Here are some of the results:

10 Meters
28.439, 28.409, 28.378, 28.348, 28.317

15 Meters
No Birdies

20 Meters
14.335, 14.275, 14.212

40 Meters
7.222, 7.253, 7.275, 7.282

80 Meters
3.832, 3.863, 3.870, 3.892, 3.953

Hopefully someone can help explain this issue or is this standard for the TS-520 ?

Is with the antenna disconnected? I think mine had a birdie around 3530 but not sure of the other bands. It may be an internal mixing product and is usually right even with the noise level on most bands and was not bad enough to redesign the receiver.

41010. So, anybody else have a 14.316 MHz birdie?

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-17 17:24:05 UTC
From: Mark L. Hammond
Topic: 41010 Message: 41010

It's on days like that I get aggravated about a loud birdie right at 14.316 MHz (the Hybrid Net freq. of course).

Wipes me out on both the TS-520 and the TS-830S. Of course, the notch/IF shift in the TS-830 helps a lot and is ...but still. Arggh!

No idea where it comes from...and shutting stuff off one by one is a task.

Complaining out loud. Feel free to ignore ;)

73!

Color burst crystal in your TV set.

I can't tune to the net because of it.

Video recorders that bring in composite video also have this crystal.

Bingo, Bob. Hadn't even thought of that. I see it's exactly the 4th harmonic of the classic 3.579 colorburst xtal. Doggonnit! I bet it's not even in my house...

Maybe we can hold an alternate net at 14.320 ;)

41017. KENWOOD HYBRID USER NET (February 17th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-17 19:10:27 UTC
From: mvgilger
Topic: 41017 Message: 41017

The Saturday's net on 40 meter we had 28 stations checking with good band conditions. Out of those, there was:

5 running TS-520(x)
3 running TS-530(x)
5 running TS-820(x)
7 running TS-830S

I was running a TS830. The rest were running non hybrids of one model or another.

The Sunday 20 meter net we had 23 stations checking in under good band conditions. There were 10 new stations checking in today. Out of all the check-ins, there were:
7 running TS-520(x)
0 running TS-530(x)
3 running TS-820(x)
4 running TS-830S
1 running 599D twiins

I was running a non hybrid TS-940. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 93, Sunday's total = 87
February 2013, Saturday's net total = 82, Sundays total = 67. (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

73's,
Mark, WB0IQK

Don't call an external interference a BIRDIE !
 Internally generated signals have been called birdies for many years . Outside interference is just interference !
"sometimes words have no meaning" is only true in song lyrics !

Like Bob says, what you are hearing the 4th harmonic of the 3.579 MHZ color burst frequency used by the older CRT TV sets.

When I found intefered with the Hybrids net I turned off the one CRT TV we have left in the house and sure enough, it decreased in intensity and changed in tone, but it is still there. There are still enough of the older TVs in use in my neighborhood to make that frequency unusable. I no longer try to tune into the 20 Meter net as a result - it's too irritating.

It's possible there may be other equipment around your place that uses that color burst crystal oscillator as well. For example, digital clocks that have a battery backup need some kind of reference oscillator, and once upon a time that was the cheapest and easiest type available.

So it's not coming from the Kenwood!

The other item that has the color burst crystal is video recorders.

I live in a retirement complex where we each have 20X20 CLOSETS. There are a lot of seniors here that still have CRT TV sets.

I wish they would move the net to a different frequency. What is special about 14.313?

Robert,
Very helpful info as I will be cleaning up my 830S in preparation for the wake up after it's long nap.
I would like to know what the name is of the "cleaned it with electronic spray cleaner" in this reference from your post.
Haven't used LPS-1 but will be ordering it also. Sounds like an excellent product.
Thanks,
Chris

Topic: 41025 Message: 41025

Hi group,

Question concerning my SM220. When on the lower bands, ie 160, 80 and somewhat 40, when monitoring the TX signal, the pattern is tearing to the left of the SM220 display. It doesn't do it on any other the higher bands, the display stays nice and centered. I did hear a loud popping one night that sounded like a cap exploding, but after performing a thorough inspection inside the unit, I could not see anything out of the ordinary.

Any ideas?

Max

41026. Rf problem with my external vfo

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-18 20:37:04 UTC
From: Brian
Topic: 41026 Message: 41026

I have a TS 830s and the external vfo 240. Works great on 40. On 15 and 17 meters I believe there is a rf problem. My ssb signal splatters and is distorted. I have key clicks on cw. I moved the vfo far as I could from the 830 and that seemed to clear things up but then it came back.

I don't believe it is a problem with the vfo. I was using a vfo 12o prior to this one and it had the same problem.

I have installed 2 ferrit loops on the line. One on each end and it does not help. The rig and vfo is grounded.

Any suggestions?

Thanks Brian

Brian,

Check the wiring at the back of the VFO socket in the TS-830.

Do you operate with different antennas? Is the problem with all of them. Is there high SWR on your antenna system, Just wonder if there is high RF level at your operating position, getting back into your VFO> ?
You should put your amateur call sign in your signature so we know who we are talking to !

Hi guys
Sadly that crap has been going on for years it is twenty by day then
75 meters at night. Are you trying to conduct a net ?? On or nearby that
frequency ??
It seems that it is some of the same group that use to carry-on the
same way on 3.901.000 14 years ago . Riley stopped some of it . But
since his retirement it appears his replacement has no teeth .. We shall
see .

Brian,

Sounds to me more like your balanced modulator may be the culprit. The two diodes have to be matched to give a good clean SSB
signal with no carrier and opposite sideband. I remember seeing someone on the web selling a newer replacement for the diodes
but old age prevents me from remembering where I saw it. See what too much Kenwood surfing does to you!!!

Has anyone had experience with an end-fed long wire and balun with their hybrid? I'm limited to what I can
hang in the yard and so far I'm not havingany luck with the 20m dipole I've put up. It's only about 20' off the
ground so I'm sure it's acting more like an NVIS antenna and for some reason I seem to do better off the ends
than I do broadside even though it seems to be resonant in the middle of the 20m band. Several folks have
recommended a Zepp or end fed and said they work really well with the hybrids but I would prefer to hear the
opinions and experience of some actual hybrid folks. I do have some really tall trees in the back yard that
I could hang a long wire on.

Hi everyone. I am looking at running my CLipperton L amp with the TS830s, but only want to run around 500watts PEP.
To accomplish this the I only need to drive the amp with about 30 to 40 watts exciter.
How can I lower the power of the TS830s so as to acomplish this?

The Clipperton L is on 120volts.
I have the Amp interface cable coming and it has the ALC cable as well.
The Clippereton L has ALC in the back, and I'm wondering if it can be used to keep the exciter power down.
Any thoughts?

Hey Jack,

I just finished typing a 50 word reply to your post and this cotton pickin Yahoo lost it again!!
I may be able to give you some advise to ponder about the wire and dipole thing. Shoot me an Email and we can talk. I have used a long wire and a dipole with my hybrids since the mid 70's. I enjoy the hobby and have no problems with my antennas. But there may be some things you should know before you waste your dipole.

Hi John,
All my attempts at end-fed wires have been poor. I get Rf in the shack and little to no contacts. In my opinion, there is nothing like a dipole if you can get it up higher. You can configure it as an inverted Vee or using your tall trees, as a sloper. All work better than an end-fed wire in my experience. Others may differ.
Good luck and 73s,
Scott, N6CIC

Brian,

Unless I missed it, nobody has asked if the rig works properly when the external VFO is NOT connected. So, does the TS-830 work properly without the external VFO?

The TS 830 works great by itself. It works ok with the vfo on 40 meters. The problem crops up on 17 and 15. I have got the problem on 17 to go away by positioning the vfo as far away from the 830 that I can get it.

Subject: [TS-520_820_530_830] Kenwood 599 twin plug

I'm putting together a 599 twins station and I need just one mating
plug. I remember someone advertising that they had some for sale, and I
think they are all gone now. Anyone want to sell me just one plug?

I use a PAR End Fed 6m antenna (obviously not w/the 830S) for both voice and digital on SSB as well as FM w/excellent results; swr 1:0 across the band. I have it set up horisontal about 100 ft from the shack and about 20 ft up.
I just got done talking to a friend on 6m using the antenna, Steve, KB1TCE, swears by them!
He has a 6m, a 20m, a 30m, an 80m, a 20/40/80 and a 20/40. Swr is 1:3 to 1:4 and no RF problems in the shack.
These antennas are usually rated at no more than 200 watts though.

73 de Jose, KB1TCD

Is there something special about the AD Dipole? A dipole is a dipole. Why would a ham pay a company to cut wire and connect it to a balun? Guess I'm just old-fashioned :)

I agree with the "Plug and Play " comment....I wonder if it could be one of the ways that maybe we can attract a younger force into ham radio....Just the opposite is true for many of us....we enjoy the effort to make things work and figure things out....although there are times I have to get my daughter or my apprentice to sort out problems I'm having on the computer ...LOL

LOL guess I should have snt THIS link instead on building a G5RV.
http://www.amateurradiosupplies.com/category-s/267.htm?Click=2662

I got rid of a lot of my modern gear a few years back, and run mostly boatanchor transmitters and receivers now for that reason. Wanted to get away from being an appliance operator. Have learned a lot as well, so it has been worth it so far.

I think it's a matter of what you have on hand, and convenience. I bought a Maple Leaf Studios wire antenna with balun on eBay because the price I paid as a unit was less than if I went to Home Depot and bought 53' of #12 or 14 wire, a plastic outdoor grade box with eyebolts, bought the ferrite core online, and then put it all together. The first thing I did was modify it, but that's another story.

That's why I like rigs with at least a few tubes in them, like the 830s. My 130s IS all solid-state, but I had to buy the SSB narrow filter and solder it in myself, and I use it as a portable where tubes might be a bit much for a car battery. I think the radios with the built-in O'scopes and antenna tuners take the fun out of radio.

when it comes to ham radios you can have way too many pushbuttons but you can never have too many knobs!

The problem today's if you do got an electronics school all you learn about I computers.

There are no more commercial radio tickets required to work in the BC industry so there are few schools that teach radio stuff.

Hey just build a dipole or any homebrew antenna, its easy, cheap and will last and educational. Three insulators, 50 cents each at a swap or less, some copper stranded number 14 or 12 wire and insulated and some RG8X or RG213 and one coax connector, some tape or better coax seal and its done.

I think it's a matter of what you have on hand, and convenience. I bought a Maple Leaf Studios wire antenna with balun on eBay because the price I paid as a unit was less than if I went to Home Depot and bought 53' of #12 or 14 wire, a plastic outdoor grade box with eyebolts, bought the ferrite core online, and then put it all together. The first thing I did was modify it, but that's another story.

That's why I like rigs with at least a few tubes in them, like the 830s. My 130s IS all solid-state, but I had to buy the SSB narrow filter and solder it in myself, and I use it as a portable where tubes might be a bit much for a car battery. I think the radios with the built-in O'scopes and antenna tuners take the fun out of radio.

I agree with the "Plug and Play " comment....I wonder if it could be one of the ways that maybe we can attract a younger force into ham radio....Just the opposite is true for many of us....we enjoy the effort to make things work and figure things out....although there are times I have to get my daughter or my apprentice to sort out problems I'm having on the computer ...LOL

Chris:

Just wrote you a long detailed explanation of the products I have used. And Yahoo ate it, so it is gone forever. LPS and CRC both make contact cleaners, but for the CRC products use ONLY the "CRC QD Electronic Cleaner" - NOT the one made by CRC for electric motors and such.

LPS-1 is not a bad contact cleaner in it's own right, but it will not evaporate like the electronic spray cleaners do, so use it sparingly.

Good luck!

Robert

41052. Solder for recap

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-20 01:20:24 UTC
From: n3kvl
Topic: 41052 Message: 41052

Hi All,

I will eventually recap my 520S. This is going to seem like a dumb question, but I would like to know what solder to use. There are simply too many varieties of the Kester solder for me to make a choice.

I have about $35 bucks in my Paypal account and its dedicated for soldering supplies. I figure I can buy a new 1lb spool, but I am wondering what to buy. I think .032 is the right diameter, most flexible for the uses I will have.

What's the best place to buy a spool?

And, can I do the recap with wick or do I need to buy a desoldering gun? I just bought a HAKKO 201 unit and it rocks :-)

Thanks in Advance
Archie

If you just need -5 kHz for working DX, you may adjust the VR2 potentiometer CCW on the AF-AVR board. So you do not need even exchance any component. Rit is shifted from the center postion, but if you have the digital display you are able to see the frequncy anyway.

The word of caution from W5RKL is still relevant. In my rig it works, but I can not guarantee every cases. Feel free to try on your own risk, but if not satified, you may always adjust the VR2 back to the original center position and no problem at all.

Archie:

You want Federal Specification QQ-S-571 solder, the kind that Radio Shack sells, among other places. And you want very thin, very small diameter solder, such as the .040 I use; thinner is Okay. I recently did not have any thin solder with me and tried to use some old larger diameter stuff; I had forgotten how much trouble it was to use that.

I am recapping a TS-520 right now, and "rolling my own" capacitor packs rather than buying the kits they sell on ebay. I hope to provide pictures later.

There is really not much solder involved in the installation of TS-520 caps. Solder wick should be adequate; I am not even using that, even though I have some. But dental tools are very useful indeed for desoldering operations. They are stainless steel, so the solder will not stick to them, you can use them to pry it away and to make holes in hot solder. Try asking a dentist for old ones but I have seen them for sale at some surplus stores. Some of those little jewelers' screwdriver will also work for that purpose but not quite as well as dental tools.

Good Luck!

I've been told by several to leave the caps alone unless they are causing a problem. You could actually cause possible problems doing it. You may be installing a lesser quality part than what your are replacing.

Curious to see what others have to say on this matter. If their is a benefit, I may look into it...

Topic: 41057 Message: 41057

Hi,
I received my loved TS-520S one week ago from Germany through eBay, perfect conditions and it arrived with its beatiful MC-50 mic.
I was so happy guys, the radio sounded great, unfortunately when I was re-arranging my shack for the new entry the mic falled down to the floor and.....bye bye mc-50 !! I think that the cartridge is broken, so I tried to open the case to remove it but it seems to be impossible, the cartridge is inside the upper cap and the cap cannot be open, I tried all...got very disappointed.
So I ask you if anyone knows how to disassembly this mic and some suggestion for possible cartridge replacements.

Thanks
73s de IT9JCB

41058. Re: [TS-520_820_530_830] MC-50 disassembly ?

IT9JCB,

Wrap a cloth around the body of the mic to protect your hand and the mic. Focus a heat gun or hair dryer on the joint between the base of the mic and the top of the body. Rotate the mic and/or heat source around the entire diameter to soften the glue used to secure the pieces.

Every 5 seconds or so wrap a cloth around the mic head to protect your hand and try to unscrew the top. Turn the top counter clockwise while holding the body. It should come loose after a short time. DO NOT use any pliers, etc. or you will damage the head and/or body.

Hi Archie,

For solder, less is better, i.e., thinner is better than thicker. I recently purchased a 1 lb. spool of Kester .031 with 66 core from Craigslist for $20 local. I believe Kester sells smaller spools than 1 lb. Some say you are good with 60/40 core and some say you will have less chance of a cold joint using a higher core, like 63/37. A little more expensive, however, but people really speak highly of the 63/37. I think the .032 is about right.

I've heard similar to what Brian said, too.

As an aside, I recently purchased a Hakko FP-101 (Craigslist) which is the predecessor to the 201. I agree with you, these solder stations are fantastic. I added 3-4 tips including a long conical and a knife. Get a long thin conical for tight board work. A few weeks ago I was able to replace the internal battery and a SMD 22uF cap on the display board of my Kenwood TM-742A using the long thin conical tip.

Welcome to Hakko!

73
Jim

Hi Robert,

Thanks for the reply. I see a Kester spec QQ-S-571 I can nab on Ebay for $25 free shipping!! What does the spec entail? Is it a MILSPEC?

Why did you elect to do a recap; did you experience problems in operation?

I look at the recap in two ways.

First, its a hobby and I think I would enjoy the simple act of working inside the rig, especially given that I am unlikely to do anything inside my FT897D.

Second, I don't believe preventative maintenance is a bad thing, even with the risks of malfunction involved. I am less concerned with the quality of replacements as I would probably not order "Chinese caps" even if the shipping was free :-)

That brings the question as to what was the source and manufacture of what you are using. Also, I would appreciate it if you could send some pictures.

Archie

I have a one owner never modified ts 830..I have cleaned the bandswitch
Ruled that out..Performed full alignment went great excellent on all other bands..However on 40m i get good drive with alc during tune up transmit is fine 150 watts out on this band
But on rx it's about 2 s units down from all other bands...Where should i look..Thanks

I believe that the new solder has no lead in it.
Does it last as long as the leaded solder? re cold solder joints.
No lead would be a lot safer in the long run and better for the environment.

You can still buy Kestrel tin/lead solder.

Hi Archie,

I use 0.047 diameter for my general purpose soldering needs including through-hole technologies. The smaller the diameter the more length you need to feed into the joint. It may just be a matter of personal preference. I use much smaller diameter solder for working on surface mount components, often under a microscope.

I often use a combination of solder suckers and solder wick. I use the suckers to get most of the solder up and the wick for the remainder.

A lb of solder should last you a long time. Back in the early 1990's I was on a business trip to Taiwan. I walked into an electronics shop on a Saturday morning and ended up buying a kg (2.2 lbs) spool of solder for about $5US. I still have most of the spool today.

73,

Bill

Subject: [TS-520_820_530_830] Solder for recap

Hi All,

I will eventually recap my 520S. This is going to seem like a dumb question, but I would like to know what solder to use. There are simply too many varieties of the Kester solder for me to make a choice.

I have about $35 bucks in my Paypal account and its dedicated for soldering supplies. I figure I can buy a new 1lb spool, but I am wondering what to buy. I think .032 is the right diameter, most flexible for the uses I will have.

What's the best place to buy a spool?

And, can I do the recap with wick or do I need to buy a desoldering gun? I just bought a HAKKO 201 unit and it rocks :-)

Thanks in Advance
Archie

Robert,

Sorry to hear that Yahoo ate that message. It would have been very useful to also post in the files section. A couple of years ago, after losing another message, "read dozens", eaten in a similarly mysterious and infuriating manner as yours, I now mostly write my messages in Word and when finished, copy them into the message area of the post. I suppose if I weren't afflicted with finger poo poos, I wouldn't have lost so many. ;-)

Thanks for the ID of CRC "QD". I went to O'Reilly's yesterday and picked up a can. Noticed a surprising variety of CRC products, including their specific "Mass Sensor" cleaner. Hmmmmm.
Also had my local ACE order in some LPS-1. Got another surprise. The price was lower than most internet sources, even here in California where most of the "good" stuff is banned.

Tnx agn es 73,
Chris

Don, understand what you are saying. I have a TS-570, but my 530 gets most of the use. I also like my Swan 500 and 250C. I just bought an HQ-170 and am in the process of getting a HT-37 to go with it. Boat anchors are alot more fun and the sound quality is so much better. I have 2 wires, 2 copper J pipe antennas up now. I am working on getting up a beam, got the tower and looking for an antenna and rotor. 73 Tom K0THP

LOL guess I should have snt THIS link instead on building a G5RV.
http://www.amateurradiosupplies.com/category-s/267.htm?Click=2662

I got rid of a lot of my modern gear a few years back, and run mostly
boatanchor transmitters and receivers now for that reason. Wanted to get
away from being an appliance operator. Have learned a lot as well, so it
has been worth it so far.

I sorry and I mean no disrespect but you don't need a balun, an outdoor grade box with eye bolts, expensive Home Depot or Lowes bare stranded copper wire, and ferrite core(s), just to build a simple and effective coax fed dipole or inverted vee antenna.

A simple coax fed dipole center support and both end insulators can be madefrom small diameter scrap pieces of PVC pipefound at most hardware stores (you have to look for them, they won't jump out at you). The wire can be simple automotive hook up wire found at most automotive stores or in the automotive section of some hardware stores. I have even used zip cord speaker wireor zip cord power cable to make a dipole/inverted vee wire antenna.Most automotive or zip cord power cable stranded wire will work fine at power levels between 300 and 400 watts. If you're going to be a power hog, running 1KW every day of the week and twice on Sunday, whether band conditions warrant the use of an amp or not, you will need a heavier gauge wire :)

Simply use the formula,

468 / <freq in Mhz>

to determine the initial overall lengthof the dipole antenna. You will have to do some physical trimming (adjusting the length equally on both ends) for the antenna to resonate on the band you are using. You don't need an expensive antenna analiyzer or impedance bridge or even "Johnny's super duper wizbang $500 antenna meter with digital read out and USB to computer interface sold on eBay" to trim (tune) the antenna to resonance. All you needis asimple SWR meter, an RF carrier and some of your time to make the end adjustments.

41069. L41 checks.

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-20 20:08:28 UTC
From: jon_g4fut
Topic: 41069 Message: 41069

I have searched for details of the L41 but have not found any responses which answer my query. I have removed the coil from my 530se which suffered an RF hit when its RX was switched on while I transmitted on another radio. I understand that L41 may have shorted. So my question is this. There are 3 lugs on the bottom of the coil and 2 on the top. One lug on the bottom left shorts with the one on the left top (I wish I could show a photo!). The right lug on the bottom shorts with the right lug on the top. Following so far ????.....There is the middle lug on the bottom which doesn't short with anything. Does this coil now require re-winding? Ken K4EAA has very kindly supplied the required wire should it need it. I sincerely hope that Ken's health improves.

41070. Re: Solder for recap

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 41052 Message: 41070

Archie:

QQ-S-571 solder is just the usual old lead/tin solder with a rosin core. It's a Federal Spec which means it is a Milspec and then some. Modern plumbing solder has a different composition than the older stuff in order to keep lead out of drinking water, and in my experience is a whole lot harder to use than it used to be.

I am doing a recap because I bought a TS-520 on ebay that has clear evidence of past power supply problems. There are smoke stains on the inside of the case, one of the 500V 100 mfd caps was smokey colored and the previous owner had cut most of the wires going to the rectifier board and inserted extra lengths of wire, in an apparent attempt to troubleshoot the problem. Powering it up produced smoke from the rectifier board and one of the resistors on the board is burned to the point of being broken in two. Based on this, I assumed everything but the transformer in the power supply circuits is bad.

I replaced the rectifier board with one I had bought as a spare, replaced the two big electrolytic caps on the board, and decided to replace all of the power supply caps. I replaced all of the resistors on the little HV board that is in front of the transformer as well.

A few years back I bought 15 68uf 500V caps on ebay for something like $19. I figured I would have to replace the caps on a Heathkit HP-23 power supply and that the other caps would be generally useful for boatanchor work, including my TS-520 and TS-820S.

For the 22uf 450V caps I found some 32uf 450V on ebay for about $2.00 each and for the 2200 uf 25V caps I found some 35V ones on ebay. Putting the 68uf caps in parallel will give me 136uf to replace each of the 100uf caps.

The kicker is: I have yet to find a bad cap in the ones I removed. Even the big 100uf 500V caps held 400VDC quite well, and held it for a long time. I still have to remove and test the 22uf caps but so far I cannot say that a shorted cap caused the power supply problem.

I got to the 22uf 450V caps this morning and will have to modify my plans after I saw how little room I have there, but I am using the exact same approach for the 500V and 450V caps. I glued the new caps to a piece of perfboard and then glued that to a ¼ inch thick piece of phenolic (or nylon) cut to the correct size to fit where the old caps are. Then I drilled and tapped holes in the nylon or phenolic to secure it to the chassis, pulled the leads from the caps through and will attach them to some newly installed terminal strips.

So good luck to all of us. Keep'em on the air!

Robert

I recently did not have any thin solder with me and tried to use some old larger diameter stuff; I had forgotten how much trouble it was to use that.
>
> I am recapping a TS-520 right now, and "rolling my own" capacitor packs rather than buying the kits they sell on ebay. I hope to provide pictures later.
>
> There is really not much solder involved in the installation of TS-520 caps. Solder wick should be adequate; I am not even using that, even though I have some. But dental tools are very useful indeed for desoldering operations. They are stainless steel, so the solder will not stick to them, you can use them to pry it away and to make holes in hot solder. Try asking a dentist for old ones but I have seen them for sale at some surplus stores. Some of those little jewelers' screwdriver will also work for that purpose but not quite as well as dental tools.

The center of the three doesn't go to anything!

I have rewound a few of the L41 Coils.

>
> I have searched for details of the L41 but have not found any responses which answer my query. I have removed the coil from my 530se which suffered an RF hit when its RX was switched on while I transmitted on another radio. I understand that L41 may have shorted. So my question is this. There are 3 lugs on the bottom of the coil and 2 on the top. One lug on the bottom left shorts with the one on the left top (I wish I could show a photo!). The right lug on the bottom shorts with the right lug on the top. Following so far ????.....There is the middle lug on the bottom which doesn't short with anything. Does this coil now require re-winding? Ken K4EAA has very kindly supplied the required wire should it need it. I sincerely hope that Ken's health improves.

Use 0.032" 63/37 rosin core solder (tin lead only). DO NOT use lead free solder. Your rig was made with leaded solder (63/37 most likely) so use that. The lead free solder has a higher temperature melt point and is prone to poor fluxing and cold solder joints. Other than a high volume, high production manufacturing enterprise that is now, by law, required to use lead free there is not reason to use anything but tin/lead solder. It just works better.

60/40 is perfectly adequate if that is what you have, but 63/37 is what is called a eutectic alloy and it melts at a slightly lower temperature than 60/40. Not enough to worry about. For this application use only ersin or rosin core flux that is inside the solder wire. Alpha, Kester, and several others good brands are out there and they are all good to use with the rosin type flux. Do not ever use acid core solder on point wired rigs. It will corrode and destroy your rig in a relatively short time. There are certain acid core and acid flux solders (331 fluxes) specifically made for surface mount type work where the water soluble flux can easily be washed away, but this is not one of those cases--keep it out of your hybrid, period.

There are companies that are currently exempt from the need to use lead free solder--those that are in aerospace and military and some telecom applications. Some of them are being forced into this compliance by the EPA sooner rather than later. All consumer and PC related manufacturing is now lead free. It is a mandate that originated in Europe and its intent is to keep lead out of the landfills and ground water. I am not sure how much of a real problem that is, but it's there and we have to live with it in our commercial stuff now, but as hobbyists we should not worry about this one way or the other. Our impact on lead in the environment is inconsequential. I have been involved with electronics for over 50 years, all of that time with tin lead solder and I have melted, in my career as well as in my hobby activities upwards of 30 pounds of tin lead solder with no issues health wise. Wash your hands, don't eat it but don't worry about it. Unless it is eaten or consumed in the water you drink for a long period of time, it is a much overblown concern than say cadmium or chromium or mercury.

Buy good quality electrolytic caps, with proper voltage ratings and rated as high in temperature as you can find. This is typically 105C. Over voltage and over temperature will kill these caps very quickly. Buy good name brand parts, avoid Chinese brand name caps, but Japanese brands are excellent in general. Be careful of your source since counterfeit parts are all over the place. I would be very leery of ebay sourced electrolytics. Digikey is a trusted source.

Have a good time working on your rig.

Larry

Hi Jon,
It certainly does appear that it is to me from what you posted.
What is the problem with the radio? Hard of hearing?

Go to radio shack for about 8 bucks you can get a spool of 032 60/40 that will last years I have used all through my college classes built an Oscope and a logic probe and wired 50power supplies for class an still reworked all my Rc car esc's and about 30 different battery combos and have barely used half of my spool in the past few years.
HAKKO 888 general work=1.2mm/ SMD fine pencil tip.

Everyone has their own way of doing things.

In a message dated 2/20/2013 2:50:39 P.M. Eastern Standard Time,
w5rkl@... writes:

I sorry and I mean no disrespect but you don't need a balun, an outdoor
grade box with eye bolts, expensive Home Depot or Lowes bare stranded
copper wire, and ferrite core(s), just to build a simple and effective
coax fed dipole or inverted vee antenna.

A simple coax fed dipole center support and both end insulators can be
madefrom small diameter scrap pieces of PVC pipefound at most hardware
stores (you have to look for them, they won't jump out at you). The wire
can be simple automotive hook up wire found at most automotive stores or
in the automotive section of some hardware stores. I have even used zip
cord speaker wireor zip cord power cable to make a dipole/inverted vee
wire antenna.Most automotive or zip cord power cable stranded wire will
work fine at power levels between 300 and 400 watts. If you're going to
be a power hog, running 1KW every day of the week and twice on Sunday,
whether band conditions warrant the use of an amp or not, you will need
a heavier gauge wire :)

Simply use the formula,

468 /

to determine the initial overall lengthof the dipole antenna. You will
have to do some physical trimming (adjusting the length equally on both
ends) for the antenna to resonate on the band you are using. You don't
need an expensive antenna analiyzer or impedance bridge or even
"Johnny's super duper wizbang $500 antenna meter with digital read out
and USB to computer interface sold on eBay" to trim (tune) the antenna
to resonance. All you needis asimple SWR meter, an RF carrier and some
of your time to make the end adjustments.

41080. Connecting a Mixer to the TS-830S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-21 03:34:59 UTC
From: Kevin, Natalia, Stacey and Rochelle
Topic: 41080 Message: 41080

Hi Guys,

I have been watching some episodes of Ham Nation.

In one of them there is a section on fitting a mixer to a modern rig.

I want to however fit a mixer to my TS-830.

From my understanding I do not put it in the front plug as this has a pre-amp in there.

So what is the best way to connect the mixer into the rig?

Regards

Kevin, ZL1KFM.

I wish you luck on your project and hope the transformer has not been damaged! From what I have been told, a bad transformer makes a hybrid a parts radio.

This is what scares me from buying radios on ebay. I don't know how he advertised it. The " I bought it at an estate but know nothing about it" covers them in a case like this.

So far, knock on wood, I have never bought anything bad on ebay and have gotten a very good price. The latest purchase was a vfo 240. Been wanting one a long time but did not want to pay $200. Got it for much less than that!

You don't even have to trim your antenna, thats just unnecessary work.

I simply used the formula in the ARRL Handbook, calculated the length of a 20 meter dipole, fed it with coax and raised it to 25ft. I was going along along working all kinds of stations.

A buddy came by with his latest purchase, a Super Whizbang $500 Antenna Analuzer with Difital Readout and USB to computer interface. (SWAADRUSBCI).
When he hooked his SWAADRUSBCI to my antenna he was quite surprised how flat it was, using just a formula, and no trimming.

Tnx Larry WA7HDZ

I sorry and I mean no disrespect but you don't need a balun, an outdoor grade box with eye bolts, expensive Home Depot or Lowes bare stranded copper wire, and ferrite core(s), just to build a simple and effective coax fed dipole or inverted vee antenna.

A simple coax fed dipole center support and both end insulators can be madefrom small diameter scrap pieces of PVC pipefound at most hardware stores (you have to look for them, they won't jump out at you). The wire can be simple automotive hook up wire found at most automotive stores or in the automotive section of some hardware stores. I have even used zip cord speaker wireor zip cord power cable to make a dipole/inverted vee wire antenna.Most automotive or zip cord power cable stranded wire will work fine at power levels between 300 and 400 watts. If you're going to be a power hog, running 1KW every day of the week and twice on Sunday, whether band conditions warrant the use of an amp or not, you will need a heavier gauge wire :)

Simply use the formula,

468 /

to determine the initial overall lengthof the dipole antenna. You will have to do some physical trimming (adjusting the length equally on both ends) for the antenna to resonate on the band you are using. You don't need an expensive antenna analiyzer or impedance bridge or even "Johnny's super duper wizbang $500 antenna meter with digital read out and USB to computer interface sold on eBay" to trim (tune) the antenna to resonance. All you needis asimple SWR meter, an RF carrier and some of your time to make the end adjustments.

Everyone has their own way of doing things.

In a message dated 2/20/2013 2:50:39 P.M. Eastern Standard Time,
mailto:w5rkl%40yahoo.com writes:

I sorry and I mean no disrespect but you don't need a balun, an outdoor

L41 checks.
Wed Feb 20, 2013 12:08 pm (PST) . Posted by:
"jon_g4fut" jon_g4fut
I have searched for details of the L41 but have not found any responses which answer my query. I have removed the coil from my 530se which suffered an RF hit when its RX was

switched on while I transmitted on another radio. I understand that L41 may have shorted. So my question is this. There are 3 lugs on the bottom of the coil and 2 on the top. One lug on the bottom left shorts with the one on the left top (I wish I could show a photo!). The right lug on the bottom shorts with the right lug on the top. Following so far ????.....There is the middle lug on the bottom which doesn't short with anything. Does this coil now require re-winding? Ken K4EAA has very kindly supplied the required wire should it need it. I sincerely hope that Ken's health improves.

The center of the three doesn't go to anything!

I have rewound a few of the L41 Coils.

Hi Gordon many thanks for the reply. Do that mean that my L41 is OK when only the outside lugs connect?

Hi Jon,
It certainly does appear that it is to me from what you posted.
What is the problem with the radio? Hard of hearing?

73,
Gordon

Gordon, that;'s the problem...its went quite deaf when I ran the other transmitter ! :-)
Cheers
Jon

n6wk_skcc3
Since L-41 sounds like it is good, I'd check Q1 on the RF board.

73,
Gordon

Re: Solder for recap
Wed Feb 20, 2013 12:18 pm (PST) . Posted by:
"roberteleazer@..." roberteleazer@...
Archie:

QQ-S-571 solder is just the usual old lead/tin solder with a rosin core. It's a Federal Spec which means it is a Milspec and then some. Modern plumbing solder has a different composition than the older stuff in order to keep lead out of drinking water, and in my experience is a whole lot harder to use than it used to be.

I am doing a recap because I bought a TS-520 on ebay that has clear evidence of past power supply problems. There are smoke stains on the inside of the case, one of the 500V 100 mfd caps was smokey colored and the previous owner had cut most of the wires going to the rectifier board and inserted extra lengths of wire, in an apparent attempt to troubleshoot the problem. Powering it up produced smoke from the rectifier board and one of the resistors on the board is burned to the point of being broken in two. Based on this, I assumed everything but the transformer in the power supply circuits is bad.

I replaced the rectifier board with one I had bought as a spare, replaced the two big electrolytic caps on the board, and decided to replace all of the power supply caps. I replaced all of the resistors on the little HV board that is in front of the transformer as well.

A few years back I bought 15 68uf 500V caps on ebay for something like $19. I figured I would have to replace the caps on a Heathkit HP-23 power supply and that the other caps would be generally useful for boatanchor work, including my TS-520 and TS-820S.

For the 22uf 450V caps I found some 32uf 450V on ebay for about $2.00 each and for the 2200 uf 25V caps I found some 35V ones on ebay. Putting the 68uf caps in parallel will give me 136uf to replace each of the 100uf caps.

The kicker is: I have yet to find a bad cap in the ones I removed. Even the big 100uf 500V caps held 400VDC quite well, and held it for a long time. I still have to remove and test the 22uf caps but so far I cannot say that a shorted cap caused the power supply problem.

I got to the 22uf 450V caps this morning and will have to modify my plans after I saw how little room I have there, but I am using the exact same approach for the 500V and 450V caps. I glued the new caps to a piece of perfboard and then glued that to a ¼ inch thick piece of phenolic (or nylon) cut to the correct size to fit where the old caps are. Then I drilled and tapped holes in the nylon or phenolic to secure it to the chassis, pulled the leads from the caps through and will attach them to some newly installed terminal strips.

So good luck to all of us. Keep'em on the air!

Robert

I recently did not have any thin solder with me and tried to use some old larger diameter stuff; I had forgotten how much trouble it was to use that.
>
> I am recapping a TS-520 right now, and "rolling my own" capacitor packs rather than buying the kits they sell on ebay. I hope to provide pictures later.
>
> There is really not much solder involved in the installation of TS-520 caps. Solder wick should be adequate; I am not even using that, even though I have some. But dental tools are very useful indeed for desoldering operations. They are stainless steel, so the solder will not stick to them, you can use them to pry it away and to make holes in hot solder. Try asking a dentist for old ones but I have seen them for sale at some surplus stores. Some of those little jewelers' screwdriver will also work for that purpose but not quite as well as dental tools.

"pwrapsengineer" pwrapsengineer
Use 0.032" 63/37 rosin core solder (tin lead only). DO NOT use lead free solder. Your rig was made with leaded solder (63/37 most likely) so use that. The lead free solder has a higher temperature melt point and is prone to poor fluxing and cold solder joints. Other than a high volume, high production manufacturing enterprise that is now, by law, required to use lead free there is not reason to use anything but tin/lead solder. It just works better.

60/40 is perfectly adequate if that is what you have, but 63/37 is what is called a eutectic alloy and it melts at a slightly lower temperature than 60/40. Not enough to worry about. For this application use only ersin or rosin core flux that is inside the solder wire. Alpha, Kester, and several others good brands are out there and they are all good to use with the rosin type flux. Do not ever use acid core solder on point wired rigs. It will corrode and destroy your rig in a relatively short time. There are certain acid core and acid flux solders (331 fluxes) specifically made for surface mount type work where the water soluble flux can easily be washed away, but this is not one of those cases--keep it out of your hybrid, period.

There are companies that are currently exempt from the need to use lead free solder--those that are in aerospace and military and some telecom applications. Some of them are being forced into this compliance by the EPA sooner rather than later. All consumer and PC related manufacturing is now lead free. It is a mandate that originated in Europe and its intent is to keep lead out of the landfills and ground water. I am not sure how much of a real problem that is, but it's there and we have to live with it in our commercial stuff now, but as hobbyists we should not worry about this one way or the other. Our impact on lead in the environment is inconsequential. I have been involved with electronics for over 50 years, all of that time with tin lead solder and I have melted, in my career as well as in my hobby activities upwards of 30 pounds of tin lead solder with no issues health wise. Wash your hands, don't eat it but don't worry about it. Unless it is
eaten or consumed in the water you drink for a long period of time, it is a much overblown concern than say cadmium or chromium or mercury.

Buy good quality electrolytic caps, with proper voltage ratings and rated as high in temperature as you can find. This is typically 105C. Over voltage and over temperature will kill these caps very quickly. Buy good name brand parts, avoid Chinese brand name caps, but Japanese brands are excellent in general. Be careful of your source since counterfeit parts are all over the place. I would be very leery of ebay sourced electrolytics. Digikey is a trusted source.

Have a good time working on your rig.

Larry

Go to radio shack for about 8 bucks you can get a spool of 032 60/40 that will last years I have used all through my college classes built an Oscope and a logic probe and wired 50power supplies for class an still reworked all my Rc car esc's and about 30 different battery combos and have barely used half of my spool in the past few years.
HAKKO 888 general work=1.2mm/ SMD fine pencil tip.

Connecting a Mixer to the TS-830S
Wed Feb 20, 2013 7:35 pm (PST) . Posted by:
"Kevin, Natalia, Stacey and Rochelle" sparcnz
Hi Guys,

I have been watching some episodes of Ham Nation.

In one of them there is a section on fitting a mixer to a modern rig.

I want to however fit a mixer to my TS-830.

From my understanding I do not put it in the front plug as this has a pre-amp in there.

So what is the best way to connect the mixer into the rig?

Regards

Kevin, ZL1KFM.

41083. Antenna question

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

From: Ld Rockne
Topic: 41083 Message: 41083

You don't even have to trim your antenna, thats just unnecessary work.
I simply used the formula in the ARRL Handbook, calculated the length of a 20 meter dipole, fed it with coax and raised it to 25ft. I was going along along working all kinds of stations.
A buddy came by with his latest purchase, a Super Whizbang $500 Antenna Analuzer with Difital Readout and USB to computer interface. (SWAADRUSBCI).
When he hooked his SWAADRUSBCI to my antenna he was quite surprised how flat it was, using just a formula, and no trimming.
Tnx Larry WA7HDZ

DOUBLE WARNING!!!

N3DG IS A SCAMMER AND A RIP OFF! He ripped me off a few months ago with a radio for sale and at the same time was selling the radio to others.
Many of you participated in the previous threads, and already know this "person." Seems to only want forms of payment that can not or are difficult to get back....ie: cashiers check, money order...etc...will not deal with paypal...as they are on to him too! You commit to buy...send check/money...bugs you numerous times asking if youhave sent the money...as he "has many interested people." Gets money...the items suddenly has "issues." Go to the home page of this board and look as messages numbered: 39735, 39737, and 39748 and you can go to QRZ.com and look at the "ham to ham reference" section too. It cost me $75 to get screwed by this person...I am surprised he has the nerve to show back up!!!
Nice catch Cliff!

STAY CLEAR OF N3DG! I KNOW!!!

Hi Joe
He sent me a email the other day,that i had QSL cards waiting for me on
that site
When i did sign up there was contacts there that i never worked
before,and of course there was a Palpal upgrade if i wanted it
Never worked RITY ,but there was a card showing that i had done
that,plus a few another bands i did not work.
Trying to cancel it now.

41094. FOR SALE: KENWOOD PC-1 PHONE PATCH @ $30

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-22 02:13:52 UTC
From: D G
Topic: 41060 Message: 41094

Slander and Libel.

Joe WB7UQU never bought a radio from me, his money was immediately returned after he begged me to buy a radio, and I was smart enough not to want his business.

Two sides to every story, especially with personal matters.

The user group is not a forum for personal, private business, Old Lady Gossip, Slander or Libel.

73 and God Bless.

DOUBLE WARNING!!!

N3DG IS A SCAMMER AND A RIP OFF! He ripped me off a few months ago with a radio for sale and at the same time was selling the radio to others.
Many of you participated in the previous threads, and already know this "person." Seems to only want forms of payment that can not or are difficult to get back....ie: cashiers check, money order...etc...will not deal with paypal...as they are on to him too! You commit to buy...send check/money...bugs you numerous times asking if youhave

sent the money...as he "has many interested people." Gets money...the items suddenly has "issues." Go to the home page of this board and look as messages
numbered: 39735, 39737, and 39748 and you can go to QRZ.com and look at the "ham to ham reference" section too. It cost me $75 to get screwed by this person...I am surprised he has the nerve to show back up!!!
Nice catch Cliff!

STAY CLEAR OF N3DG! I KNOW!!!

I'll check those transistors as I am taking the RF board out of the 530s.

According to QRZ, his bio indicates he is the smartest multimillionaire cyberwhiz on earth. I gather that he is next in line as Pope.

I guess small-time scamming is just his night job.

If he does actually have anything to do with eQsl (his bio says he is on the 'board'), I'll actively campaign to get the amateur community to cease using it.

Gordon
I know posts are to be kept to only about the Kenwood hybrids,but if
those posts were not made i would have never known about N3DG
I don't mind any posts that make our fellow hams aware of any radio
ripoffs.
Is there a yahoo group on here just for ham ripoffs
Very sad when a ham rip's off another ham,but there will always be some
bad apples,just like bad Operators who disrespect the hobby.

41109. SM220 Jumper

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-22 16:31:21 UTC
From: Rick
Topic: 41109 Message: 41109

To use the pan adaptor on my TS-520 I have to do a little internal modification on the transceiver. It calls for RG174/u (75 ohm) coax to run from the IF to the eight pin accessory plug on the back of the TS-520. Then I need to make a cable from the accessory plug terminating with a RCA plug. It doesn't mention what kind of coax to use for this one. I assume the RG174/u would be used but I'd like to verify that before I go any further. I got my BS-5 used so none of the cabling or components for the modifications came with it. Will someone who has been through this let me know which coax and an optimum length to use for this wire going from the TS-520 to the SM-220/BS-5?

Thanks,
Rick / K5IAR

Watch out for a HAM on eBay who calls himself "Norbyx". He likes to quote a low price for shipping, and then after the auction ends he shakes the buyer down for more money, or if he listed the rig with something like an external VFO and you refused to pay the extra shipping, he says "ok" but then he doesn't ship the accessory. I went against him on eBay and was declared in the right, but by that time the rig had been shipped all the way from a contest shack in Costa Rico (it was supposed to ship out of Florida). eBay's solution was for me to ship it all the way back to Costa Rico. I ended up keeping the radio and giving up on the VFO, a move I regret now.

Reply
The donations, which are not required by the way, are used to keep the
site up and running, along with revenue from advertisers. The site has
been on the go now since 1998 and is run as non profit, most of the time
it runs at a loss because most members don't donate, and it is run that
way because that is the way Dave, N5UP, wants to run it. All of the
volunteers who work at eQSL, including myself, do so for free to help out.
N3DG does some work getting people to advertise on the site, and I think
he probably makes a little money from that. BUT! That is his only
involvement with eQSL.
I have been a little suspicious about him for a while now for various
reasons and have mentioned my suspicious to Dave, that's why I asked you
the question when I saw he was in the referred by field in your profile.
Dave

Topic: 41114 Message: 41114

This is probably a dumb question for those of you who are much more in the know than I am, but. is it possible to have the TV-502 and TV-506 connected at the same time on a TS-520? I realize there is only one transverter connection on the TS-520, but I thought maybe there is some kind of adaptor to accommodate both the 6 meter and the 2 meter units.

Thanks for any help or advice you can offer.

Topic: 41115 Message: 41115

Maybe someone can help or point me in the right direction. I have an ancient TR 2400 2m handheld that I use on a regular basis. I have the ST 1 charging base and power supply. The ST 1 just died (no output) and I'd like to fix it. I haven't been able to find a schematic, so was wondering if anyone had suggestions, etc.

btw, am listening to my TS 830s as I type this...

Thanks in advance.

Rick,
I have never used either the TV-502 or TV-506 but had planned to at one time so I had read the associated manuals. My understanding is the TV-502 connects directly to the TS-520 as does the TV-506 when used alone. When both are used the TV-506 plugs into the TV-502 which then plugs into the TS-520. That's all I can tell you. Hope it helps.

41120. TS-520S - No ALC Indication on transmit

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-23 21:08:14 UTC
From: kd8rap
Topic: 41120 Message: 41120

Greetings all. Name is Brendan, and I am a new member here, and just checked in to the net for the first time. My first HF rig was a TS-520 and now I use a TS-520S. I had a bit of trouble getting through the QRM checking into the net because I am on my backup QRP rig until I can get my Kenwood sorted out.

Just wanted to follow up about an intermittent problem I have been having that I mentioned on the net. I was having two problems and solved one but not the other.

Problem 1: The rig would not go back in to receive mode after transmitting. (This problem was solved after replacing relay RL1)

Problem 2: I have an intermittent problem where I have no ALC indication on the meter while I am transmitting, it stays completely still at the bottom of the scale. If I switch bands (say from 40 to 20 meters) I have ALC indication again, but not if I switch back to 40 meters I won't have ALC indication again. It happens on multiple bands intermittently. While this is happening I still have normal output power on my wattmeter, and can still make contacts, just no ALC indication on the meter.

I was hoping replacing the relay would fix both issues but it didn't fix the second.

Does anyone have any ideas on where to start looking? Any specific area or component of the ALC circuit?

Thanks in advance! 73's Brendan KD8RAP

41121. Meter Dead.....Tuning Strange

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 41121 Message: 41121

Hello All,

Today, the TS-520S is not functioning.

The first symptom is that the RF (receive) meter is dead not movement at all.

Second, when tuning in the bands, it is not possible to tune without distortion of the incoming signal.

So, obviously something happened. I am going to start looking in the manual and trouble shooting I have, but I thought I would check here to see if there are any common recurring things.

Thanks,
Archie

41125. T599 Calibrator Issue

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-24 00:54:48 UTC
From: daedalusnj
Topic: 41125 Message: 41125

I recently bought a really sweet set of Kenwood Twins. All is great except something with the calibrator is messed up. When I pace the switch in the CAL position I can hear a relay (?) rapidly clicking on and of for about the seconds, then nothing. I cannot hear anything on the receiver except its own 25KC calibrator signal. Yes, the receiver to transmitter cable is in place. Of course, that means I can't zero beat and get them in sync. I looked in the manuals (operator and service) and can't find anything obvious.

Any ideas would be appreciated.

41132. ts520se sidetone question

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-24 05:09:22 UTC
From: tfrugia81
Topic: 41132 Message: 41132

Hello all. I'm a new owner of a kenwood hybrid. I absolutely love it.

I searched the group to try and find an answer to my problem. There are many similar posts but not quite what I am experiencing.

If I have a key plugged in and switch to CW, I hear a constant sidetone. If I put the radio in "send" there is no RF output, but I hear the tone. If I press the key, it transmits as it should. The sidetone never stops until I unplug the key.

This is just a standard straight key on a mono plug. I even tried plugin in a plug with nothing attached and it does the same thing. Oddly enough, it randomly will work fine. Today I left the rig turned on in CW mode for about an hour. When I came back the tone was gone, but switching to "tune" and back to CW caused the sidetone to come on and remain on.

Any ideas? I took the case off and the plug is clean and looks brand new.

You don't need to zero beat the pair together. With the connecting cable in place, either the transmitter or the receiver are slaved to the selected VFO. Mine seem to track perfectly. I will test my calibrator today, and see how it act's .I usually use the transmitter as the slave VFO, however the receiver VFO might be a better choice due to less heat drift..

Yes sir when I looked at the manual for the 502 it shows two transverter to transceiver jacks. You plug the 502 into the TS-520 and plug the 506 into the 502. It has all the necessary plugs/jacks and so forth.

Now all I have to do is make the deal for the 506 and find a 502. Hopefully, it won☐t take too long I☐m getting☐ old! HI HI

Thanks again for the help!

Go to Gordon Benjamin's site N6WK.com and you will find the manuals and service manuals for both the TV-502 and the TV-506 plus many others. You'll want to bookmark the site because of the wealth of information.Butch

Thanks, Butch. I have no documentation on either, so, I☐m flying blind. I

sure hope you☐re right. That sounds like the logical way for them to work.

Subject: Re: [TS-520_820_530_830] Transverters

Rick,

I have never used either the TV-502 or TV-506 but had planned to at one

time so I had read the associated manuals. My understanding is the TV-502

connects directly to the TS-520 as does the TV-506 when used alone. When

both are used the TV-506 plugs into the TV-502 which then plugs into the

TS-520. That's all I can tell you. Hope it helps.

Regards,

Butch Lewis

SECOND TRY - Yahoo just ate my previous response......

Thanks for the inputs, guys. Long story short, before Yahoo munches on this message too, is it works. It's obvious once you know the answer. When the transmitter is in calibrate and in CW mode it will only be heard on the receiver if the rcvr function switch is set at MONI ! It makes perfect sense. Wish the manual mentioned that but, I guess most ops are sharper than me!

I hope to hear some of you on the 20M net this afternoon.

OK - I now officially qualify as the idiot of the month!

A little thinking would have led me to realize that I would not hear the transmit signal in CAL mode unless the receiver function switch was in the MONI position so the sidetone comes through. It's rather obvious after you know the answer. My only cop out, for what it is worth, is it would be nice if the manual mentioned that step. That's not much of an excuse however!

Thanks for the replies, guys. I'm sure to be back and ask more questions to maintain my Idiot of the Month status :)

PS: Pete - it would be great to get together at some point as I am sure I can learn a lot from you.

I hope to hear some of you on the 20M net this afternoon.

41139. KENWOOD HYBRID USER NET (February 24h, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-24 19:20:06 UTC
From: mvgilger
Topic: 41139 Message: 41139

The Saturday's net on 40 meter was run by Jimmy, WB2KNR from Newport, NJ., He had 21 stations checking with good band conditions. There were 7 new stations checking in. Out of those, there was:

8 running TS-520(x)
1 running TS-530(x)
3 running TS-820(x)
3 running TS-830S
1 running a set of 599D Twins

Jimmy was running his TS-830s. The rest were running non hybrids of one model or another.

The Sunday 20 meter net we had 20 stations checking in under poor band conditions. There were 3 new stations checking in today. Out of all the check-ins, there were:

7 running TS-520(x)
0 running TS-530(x)
3 running TS-820(x)
5 running TS-830S
1 running 599A twiins

I was running a non hybrid TS-940. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 93, Sunday's total = 87

February 2013, Saturday's net total = 103, Sundays total = 87. (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

Glad the relay was able to hear you. We were on
14.316.50 today to help some of the guys that
have birdies from their TV's right on 14.316.

On 20 meters your off the back of my beam, so
between bad band and back of the beam, I did not
hear you at all. If your around Saturday, you can
check into the 40 meter net at 3:30 eastern on
7.235. East cost stations come in real good into Ohio.

Some further input on hearing the transmitter calibrator. This assumes
you also have the "transceiver" cable (the one with the big Hirose
connectors) attached. Band switch of both receiver and transmitter have
to be on the same band. Plate, Load, and Drive controls should be roughly
peaked for the band you're on or you might not hear the transmitter
calibrator. If the slide switch (Separate/Transceive) on the back is set
to separate, the calibrator on the transmitter will only work if the VFO
Select switch is on NORM or TRCV(Rx).

Hi Ken,
thanks for the information....ooh my god it seems a very complicated operation ! so they glued the two parts, I wonder why.
Well, but before to try open it I would like to know more about possible replacements of the cartrige, which brand, type etc, any suggestion ?
In the while I bought an home studio mic here (Philips sbc md150 dynamic micro) and mounted it on the MC-50 support. I got very bad results, too low and too bassy audio. May be I'm missing the 600-50K step-up transformer needed to drive my TS-520S..??
I bought one here and payed about 15$, I'm waiting for it.

Thanks and 73s

Rick,

I have both transverters hooked to my TS520S. They daisy-chain together. The TV502 hooks directly to the TS520 then the TV506 hooks to the TS502. Do not turn both transverters on at the same time the 502 overrules the 506... The other thing to note is the antenna to the TS-520 should be disconnected or routed to a dummy load while using the transverters, since strong RF signals can still get inside the 520 from the HF antenna, and there is the possible leakage of qrm from the 520 to the outside world! If you are planning to do a lot of 6 and 2 meter ops with this set up you might be disappointed in the sensitivity on receive compared with a dedicated modern 6 or 2 meter rig. My FT817nd runs circles around the transverters in the area of sensitivity and selectivity. The transverters only put out about 4 or 5 watts so you will be running QRP as well. They look nice on the bench and are fun to fool with but don't expect contest quality operation.

Claudio,

Dismantling the MC-50 is not difficult and takes only a couple minutes. I have opened several MC-50 and MC-60 mics and it never took much heat or more than a minute or two. Just be careful to keep turning the mic as you apply the heat so you do not concentrate the heat in one place.

I have never had the need to replace the mic element in a MC-50 so I can't offer a personal recommendation. I would get it a part and then determine if a new element is needed. It is possible that a wire broke off and you can repair it.

As for the Philips mic, it is 600 ohms which is not a good match to the TS-520S mic input impedance of 50K ohms. The impedance matching transformer you purchased should help with that,

Thanks for the info, Ken. I will use the transverters from time to time, but I understand they would not compete with a dedicated rig or even a little more modern multi-band rig. Thanks for the tips on how to hook them up and on what not to do. I would very likely have made the mistake of turning them both on at the same time. My goal is to assemble a totally complete TS-520 station. I lack the transverters (I think I have found them both) and the amplifier. Unless I find a techie special or one that has been fried I doubt I'll be getting the amp anytime soon. Too much money for an old timer on a fixed income.

Thanks Again.

Rick / K5IAR

41147. POINTER for TS-830S

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-02-25 02:23:35 UTC
From: KA4AQM
Topic: 41147 Message: 41147

Greetings from a desperate TS-830S owner. While removing all the knobs from my faceplate last night I got heavy handed and cracked in half the POINTER which sits behind the PLATE knob on my TS-830s....does anyone have one I can get ASAP/

Thanks in advance.

Have you tried gluing it back together? I haven't done exactly that, but
it might be worth a try.

Topic: 41069 Message: 41149

I've been struggling with having to replace L41 since the TS530se I have was missing L41. I think I've found a core (it's a Toko 10K series 27uH inductor). What I found out is that the three pin side is the secondary with a tap (middle pin) and the two pin side is the primary -- that's standard for the Toko and similar parts. BUT for L41 the pin arrangement is different each of the pins on the two pin side is connected to the matching pin on the three pin side. I can't remember which end is primary and which is secondary, but it's easy to figure out from the board layout.

Ken Kemski put me onto a note about rewinding these cores. It can be done but it's delicate work.

I'm still struggling with my replacement; I think that Q1 may be dead also but I have limited time and equipment so the work goes slowly. Any advice from anybody's experience would be greatly appreciated.

My TS-820S had the exact same problem when I bought it. I found the problem to be a broken contact on connector FIX3-11 not making connection to the pin on the pcb.

Hello all. I'm a new owner of a kenwood hybrid. I absolutely love it.

I searched the group to try and find an answer to my problem. There are many similar posts but not quite what I am experiencing.

If I have a key plugged in and switch to CW, I hear a constant sidetone. If I put the radio in "send" there is no RF output, but I hear the tone. If I press the key, it transmits as it should. The sidetone never stops until I unplug the key.

This is just a standard straight key on a mono plug. I even tried plugin in a plug with nothing attached and it does the same thing. Oddly enough, it randomly will work fine. Today I left the rig turned on in CW mode for about an hour. When I came back the tone was gone, but switching to "tune" and back to CW caused the sidetone to come on and remain on.

Any ideas? I took the case off and the plug is clean and looks brand new.

Dave....I just (Today) rewound the "L-8 " coil in my deaf TS-820....I have not got it back together yet but....the coil work was something I had to do....they just are not available anymore.....Ken's Hybrid website gave me the pictorial boost I needed to do such fiddly work...It took me a couple of tries (I broke the fine wire the first time.....I took a deep breath and set my rewind station up a little better so I could move around the tiny coil without snagging something....biggest problem I had was removing enough of the coating on the magnet wire to get some sort of solder joint to the leg of the coil....I managed.....I checked to see if there was continuity from leg to leg and not to the other set of legs (Primary / secondary)...it checked out OK....I think anyone who is familiar with "fly" tying would do great at this....although the mono filament for fishing lures is tougher than the #42 magnet wire needed for this work....Good luck....

Regards....Wes....VA6DWH

Tyler, your TS-520SE won't have a FIX3-11, that is just the place I located the problem in my TS-820S. Sorry, I should have pointed that out.

Your problem, however appears to be the same as mine was – loss of cutoff voltage to the sidetone oscillator. The sidetone oscillator runs when the key is closed but it is cut off by a negative voltage applied when the key is open.

In the TS-520SE, the sidetone oscillator is Q6 on the AF Unit (X49-008-01). The "KEY" terminal on that board should have a negative voltage of about -65 vdc in the key-up condition (it should be the same as the open-circuit voltage across your key contacts). Check there to see if the negative voltage is present. I don't know whether the TS-520SE uses a wire-wrap connection at that point or not but if it does, then I suspect you will find it to be the problem. If it is a bad wire-wrap connection, clean it good and solder it.

If you don't have the manuals for it, you can download them from Gordon's website as I just did (thanks, Gordon!).

Let us know what you find.

Claudio,

Since the original message from you does not show up in the archived messages, I will answer using Ken's response.

I had a similar issue - opening up a TS-50 mic to fix the Push-To-Talk (PTT) switch. I Googled/BINGed the question and I thought I bookmarked the page, but can't find it, so here is what I have in my memory.

1.) A CLEAN cloth towel to work on and catch the pieces in your work space.
2.) Place aluminum foil over the sound-catching / open portion of the mic to protect the pick-up element from the heat.
3.) Use a heat gun to heat the area between the aluminum foil covered area and the main mic body. Use GLOVED hands to occasionally grasp the two "halves" of the mic and turn them to see if they are loosened up yet.
4.) continue to apply heat from the heat gun to the area separating the two mic halves until you can unscrew them.
5.) When the two halves are separated, carefully remove the parts, noting how they go back together!

I found a "photo bucket" website of the process, but where is the explanation?
PHOTOS: < http://s261.beta.photobucket.com/user/ai4wm/library/Cleaning%20Kenwood%20MC-50%20Microphone >

If I find the verbal explanation - better than mine - I will repost.

73,
Mike, wb6csh

Hi Ken,
thank you for encouraging me, I will try do it after finding a cartridge replacement. I'm looking here to some cartridges in the net, there are someones which are used for studio mics, also the famous HC4/5 are available as but at high cost (!!). I'm sure that the transformer will improve a lot, having more level after the step-up (I expect about +15dB of boost in level) I could use a passive bass tone control as that used in the guitars pickup to correct the bass response.
All this for our loved TS-520S rig !!

73s
Claudio

Thanks Wes. I've rewound the coils and agree it's a job for a steady hand and a good magnifier.

My problem is that I had to substitule a different coil and I'm not sure if it's the same material as the original L41. Either that or if someone could tell me the inductance of the primary and/or secondary of a good L41.

41159. DG-1 display repaired. Was missing 1 digit.

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Here is a quick write-up to help others in case they find the first digit to the left of the decimal point not displaying correctly.

Almost 2 years of missing the first whole number on my tech special TS-820s. About 10 different attempts to fix and I finally have the digital display working!

Machine: TS-820S
Problem: Digit to the left of decimal place missing on digital display most of the time.

Bandswitch: wwv, 1.8, 3.5, 7, 14 = digit to the left of the decimal point missing. WWV and 14 show the "1" but not the "5" or "4."

Bandswitch: 21 = display shows "29" instead of "21."

Bandswitch: 28, 28.5, 29, 29.5 = display works correctly.

Cleaning external connectors = no change.
Cleaning internal connectors = sometimes works correctly for a few minutes.

Adding wire to all but the blind through holes = sometimes works correctly for a few minutes.

Actual problem: Corroded trace afforded partial connection.

In my case I think the trace was between IC 9 and IC10 on the back (no parts) of the counter board. I scraped the trace off the board almost by accident with my fingernail. Re-tested the board and it didn
't work any worse so I knew I was on the right trace -er track.

Repair:

The gap was way to big to bridge with a blob of solder. I removed the repair attempt #1 blob. I used a strand of .0040" wire to bridge the gap. I used a standard 35watt soldering iron. One side at a time, then cut off the extra wire. Not real proud of my workmanship on this one, but not bad for a hack with a big iron and aging eyes.

Image uploaded to photos.

It was probably Ken at K4EAA.com. He has a lot of the missing pieces for the old TS series radios and also does restoration
work. I just ordered the caps and resistors for a 520 that's now back on the air after 25 years. You can also get some good deals
on ebay. There are some folks there that sell all three of the vacuum tubes, a matched pair of 6146Bs and the 12BY7 driver for
around $60.

I picked up a new TV506 for my TS520 and was very disappointed in it's receiver lack of sensitivity. I hald other older tube (nuvistor) converters and an SX101a receiver that heard all the weaker signals from 100 + miles away and the 506 only heard locals on the same antenna.

Subject: RE: [TS-520_820_530_830] Re: Transverters

Thanks for the info, Ken. I will use the transverters from time to time, but I understand they would not compete with a dedicated rig or even a little more modern multi-band rig. Thanks for the tips on how to hook them up and on what not to do. I would very likely have made the mistake of turning them both on at the same time. My goal is to assemble a totally complete TS-520 station. I lack the transverters (I think I have found them both) and the amplifier. Unless I find a techie special or one that has been fried I doubt I'll be getting the amp anytime soon. Too much money for an old timer on a fixed income.

Thanks Again.

Rick / K5IAR

Subject: [TS-520_820_530_830] Re: Transverters

Rick,

I have both transverters hooked to my TS520S. They daisy-chain together. The TV502 hooks directly to the TS520 then the TV506 hooks to the TS502. Do not turn both transverters on at the same time the 502 overrules the 506... The other thing to note is the antenna to the TS-520 should be disconnected or routed to a dummy load while using the transverters, since strong RF signals can still get inside the 520 from the HF antenna, and there is the possible leakage of qrm from the 520 to the outside world! If you are planning to do a lot of 6 and 2 meter ops with this set up you might be disappointed in the sensitivity on receive compared with a dedicated modern 6 or 2 meter rig. My FT817nd runs circles around the transverters in the area of sensitivity and selectivity. The transverters only put out about 4 or 5 watts so you will be running QRP as well. They look nice on the bench and are fun to fool with

but don't expect contest quality operation.

When I was a new ham some Elmer buddies convinced me to put up a wire dipole antenna. I used a ladder loc from WA1FFl, some 16 ga 450 ohm ladder line and about 130' of #12 THHN wire from Home Deeps. I used one clothes line pulley, dacron rope, good insulators and some sash weights. I do not like heights, so I paid some local tree workers to put it up in trees in my yard. One end is about 50' off the ground and the other is about 35' although the antenna is level, ground is sloped. I bought a 4:1 balun kit from Palomar Engineers and got it all hooked up. It worked very well with my Drake TR-4C and then became my favorite with my TS-530. I am no expert and have limited experience, but this was very easy to build, install and tunes easily. I would never be without one!

Best of luck, Peter.

Got it, thank you for the clarification.

I measured voltage at the KEY terminal on the AF board, and it indeed has -63ish volts DC with the key open. All of the connections on the AF board look ok to my naked eye. I traced the ones that I could easily follow and they seemed ok (using a meter to test continuity).

I am very much new to these radios (and radio repair in general). Is there anything else I should be looking for? I appreciate your help!

Ok, good. The purpose of this –63 vdc is to inhibit the sidetone oscillator when your key contacts are open. It does this by reverse biasing diode D3, thus turning it off and interrupting the feedback path necessary for Q6 to oscillate.

It appears that your –63 volts is either not reaching the diode or else the diode is shorted. A positive voltage of about +100 vdc enters the AF board at the “STB” terminal. This +100v and the voltage at the “KEY” terminal (-63v key up, 0v key down) are combined through resistors R35 and R36 such that D3 is forward biased when your key contacts are closed but when the key contacts open, the –63v “overpowers” the positive voltage, killing the oscillator.

One other possibility would be for the R35 and/or R36 values to have changed such that the negative voltage is not quite able to overcome the positive voltage.

Measure the voltage at the anode of D3 under key up and key down conditions. Also, if you are using an analog meter or a digital meter with a diode test function, measure resistance both directions across D3 (be sure there is no voltage present on the diode when you do this).

Let us know what you find.

73,
Alan, KD5R

Hi and thanks for the link. That's the guy I dealt with before. He has some really good stuff.
Thanks again.

Hi to all. A while back I ordered some precision resistors and a 12BY7 driver tube from a source recommended here. I can't find the name of this source and don't remember the name. It was a ham who specializes in this stuff. I need some additional parts. Can anyone help me out?
Thanks & 73,

Great antenna experience. Always like those 'tried'n proven' antenna methods that just seem to work. Question: How well does it work on 10m? Does it tune real sharp on your tuner? I have a G5RV and it's real touchy to tune up on 10m. (My 520 is still happy tho)

Bob, KD5MHQ

--- On Mon, 2/25/13, Noodle10536 <pureenduro@...> wrote:

When I was a new ham some Elmer buddies convinced me to put up a wire dipole antenna. I used a ladder loc from WA1FFl, some 16 ga 450 ohm ladder line and about 130' of #12 THHN wire from Home Deeps. I used one clothes line pulley, dacron rope, good insulators and some sash weights. I do not like heights, so I paid some local tree workers to put it up in trees in my yard. One end is about 50' off the ground and the other is about 35' although the antenna is level, ground is sloped. I bought a 4:1 balun kit from Palomar Engineers and got it all hooked up. It worked very well with my Drake TR-4C and then became my favorite with my TS-530. I am no expert and have limited experience, but this was very easy to build, install and tunes easily. I would never be without one!

Best of luck, Peter.

I am looking for five (5) feet of miniature RG-174 (50 ohm) and five (5) feet of miniature RG-179 (75 ohm) coax. There are plenty of retailers that sell it, but they sell it in rolls of 25' to 1000' or in pre-assembled jumpers that do not fit my needs. I'll be more than happy to pay a fair price. Or if anyone knows of a business or individual that sells it by the foot I would sure appreciate their name and email address.

Thanks and 73,
Rick / K5IAR

Rick,

Try these guys:
http://www.halted.com/

On their website they list stuff in rolls but I know that they sell a lot of different types of wire and cables by the foot at their retail store here in Silicon Valley. They should be willing to cut you some by the foot if they have it and ship it to you.

73, Bill

From: Alan Riley
Topic: 41132 Message: 41179

Well, the video tells me you may have a bad TR relay causing the intermittent loss of receive audio. You can check for this by turning on the internal 25 kHz calibrator. If it is the TR relay, the signal from the internal calibrator will still be at it’s normal level even though the received signal off of the antenna has dropped out. Connect a microphone and key it briefly a few times and see if the signal from the antenna returns. In addition, exercise the external receive antenna switch on the rear of the rig since the receive signal path goes through it too.

On the constant sidetone issue, look closely at all soldered connections in the sidetone circuit and especially any wire-wrap connections. You should be able to track down the problem there with your voltmeter. Also, make sure the board mounting screws are tight.

73,
Alan, KD5R

Thanks so much for all the replies and help. I am now I'll be able to find both of them easily.

This is a great list!

73,

Rick / K5IAR

Hi Bob,
In my experience any dipole cut for the center of the band you want to work, fed with 50 ohm coax, and up as high as you can get works very well and is not difficult to tune. You can configure the dipole as flat, an inverted vee, or a sloper depending on your location and available trees. If possible I like a vee because it is less susceptible to winds snapping the ends. For 10 meters probably just a flat configuration would work very well.

I used a ladder loc from WA1FFl, some 16 ga 450 ohm ladder line and about 130' of #12 THHN wire from Home Deeps. I used one clothes line pulley, dacron rope, good insulators and some sash weights. I do not like heights, so I paid some local tree workers to put it up in trees in my yard. One end is about 50' off the ground and the other is about 35' although the antenna is level, ground is sloped. I bought a 4:1 balun kit from Palomar Engineers and got it all hooked up. It worked very well with my Drake TR-4C and then became my favorite with my TS-530. I am no expert and have limited experience, but this was very easy to build, install and tunes easily. I would never be without one!

You can tune the dipole quite easily by simply using the formula to get the initial end to end length then adjusting the overall length at both ends for the lowest SWR at the center of the band. The formula is:

468 / freq in Mhz

Allow some excessive wire, 2 to 3 feet, on the ends. Simply wrap the excess wire along the end wire on both ends. Do not cut the excess wire until you have the lowest SWR at the center of the band. You actually do not have to cut the excess wire just leave it wrapped along the ends. The wrapped excess wire will NOT cause any problems nor will it affect the SWR and performance of the antenna.

I used this method to build and tune a 40 meter inverted vee 25 feet at the center over a pine tree limb. The SWR at the center of the band is 1.2:1 and 1.6:1 at the top and bottom of the band. I work into Europe, South America, South Pacific, and Asia with only 90 watts from a Heathkit SB-100 or Drake B and C Line. The average signal report is 589 on CW.

Topic: 41186 Message: 41186

Hi All,

I'm new to the group and recently acquired a TS-520 at an estate sale and started cleaning it up to get it on the air.

It was sitting for awhile and came from a heavy smoking environment but outside cleaned up real nice. Transmitter fired up and am getting over 100W out on all bands - getting great audio and signal reports and everything seems to be working fine ..... except the VFO.

It had some dead spots and signals would drop in certain portions of the dial - Same places on each band.

After reading a lot of the threads here and asking some questions on the Kenwood net - I opened the cover, removed the side door from the VFO, and shot/sprayed some Deoxit in on both ends of the capacitor shaft.

I worked the tuning knob back and forth several times and this seemed to work a little, but still some signals (and xtal calibrator) along the low end of the dial dropped out.

So, a few days later I reopened and gave it another couple shots of Deoxit.

Now - the signals along the dial are fine and nothing is dropping out - However it looks as though I've created another problem.......the VFO is very sensitive and touchy now. I can move the rig, tap the case or bump the desk and the frequency wobbles/changes a bit.

It wasn't this unstable after the first shots of Deoxit - but now it's real touchy.

I'm inclined to remove the entire VFO unit to open it up and clean.

I'm looking for advice before I do that. Any suggestions where to start?

Thanks!

Brian N8TC

Brian,

Welcome aboard.

It is not necessary to actually DEOXIT both ends of the air variable cap in the VFO..usually just the rear. DEOXIT is part solvent...so you may have blasted some crud where it should not be. It also has a "stay behind" lube...which I think is a mineral oil base. I recommend recleaning the VFO. Get some "canned air," aka "air duster." It's available at office/computer/electronic stores...I think the 'olWALMART has some too.
Spray some DEOXIT on the rear wiper...turn it through its travel numerous times...and blow off with the "canned air"...spray another small amount..rotate through travel numerous times...let dry...while inspecting the front of the air variable where the bearings are...might as well lube them while you have it open. Check for other possible contaminates...leave side door off...check for proper operation before putting it all back together. I have had an 820 VFO act erratic...after "cleaning" as I did not blow off/out the junk...and after re-cleaning and blowing it outit worked fine. I would also inspect the immediate area around the VFO...you may have accidentally knocked something loose. Having to remove the VFO is a real pain!

Brian:

VFO dropouts are a very common problem.

I recommend you take the VFO out of the transceiver (there is an Internet tutorial on how to do this), remove the VFO outer case, clean the tuning cap with a cleaner such as CRC QD electrical contact cleaner, and lube just the pivot points and shaft wiper with a small amount of LPS-1.

Good luck!

Hey guys,

I just picked up a TS-520 to add to my shack and it seems that this radio has an issue. I am not sure if this was due to shipping or a preexisting condition, but the radio seems completely deaf. It does transmit, though I never gave it full power.

What would cause the lack of RX? The analog meter does not move, and I hear nothing from the speaker but a little crackle when I change bands. Same with headphones.

I have tried moving the function switch to the 25khz cal position and running the VFO through the band I do not hear the tone or see any needle deflection.

Any ideas?

Hi Mark,
Thanks for the SDR/830S demos. Checked both of yours and it's pretty neat to see the mix of technologies at work. Wonder how small a SDR radio will get? The FUNcube Dongle Pro+ is almost as amazing as the TS-830S!!

Yes it is. The radio also came with a DG-5 display and the frequency it shows matches where I have the bandswitch and VFO, so I'm pretty sure that is working. Also, the radio will transmit, I don't think it will do that without the VFO plug in back.

Any other ideas?

Thanks

BRENDAN DID U REPLACE BOTH RELAYS? WHEN U REPLACED THE RL-1 DID U REPLACE THE RL-2 AS WELL DID U REPLACE THEM WITH NEW OR USED RELAYS? WHAT DOES YOUR S-METER DO IN RX? IS THAT WHEN ITS INTEREMENT? WHAT DOES YOUR S-METER DO WITH THE MARKER SIGNAL TURNED ON? DID U CLEAN ANY OF THE SWITCHES WITH DEOXIDENT? AT LEAST DO SO EXPECIALY THE PANEL METER SLECTOR SWITCH AND THE BAND SWITCH. IF YOUR METER IS GOOD IN RX THEN 1ST TRY REPLACING RL-2. IF REPLACING RL-2 MAKES NO DIFFERENCE THEN THE NEXT THING U COULD TRY WOULD BE TO CLEAN VR-1 AND VR-2 ON THE I.F. BOARD WITH SOME FADER LUBE DEOXIDENT. MARK THE LOCATION OF THEM WITH MAGIC MARKER OR SOMETHING SO U CAN RESET THEM BACK TO THE SAME SPOT AND AFTER U USE THE DEOXIDENT WORK THEM BACK AND FORTH A FEW TIMES. ANOTHER THING TO TRY IS TO MEASURE THE VOLTAGE AT THE SM TERMINAL ON THE I.F. BOARD WHEN S-METER SHOWS FULL ALC READING YOU SHOULD HAVE ABOUT .4 TO .5 VDC AT THAT TERMINAL. ONE HANDY PICE OF
EQUIPMENT U SHOULD HAVE IS A GOOD VTVM AND R.F. PROBE AND ALSO A MILI VOLT METER OR GOOD SCOPE AND A SIGNAL GEN IF U ARE GOING TO WORK ON THE HYBRIDS U NEED AT LEAST THIS ALONG WITH THE SERVICE MANUAL. HOPE THIS HELPS U. LET ME KNOW HOW U MAKE OUT. JIMMY.

BRIAN DO U HAVE THE 9 PIN CONNECTOR INSERTED INTO THE SOCKET IN THE BACK OF THE RIG WITH PINS 8AND 9 SHORTED? IF NOT U CAN USE A PICE OF WIRE INTO THE HOLES IF U DONT HAVE A 9 PIN VFO PUUG WITH THE RIG. IF U HAVE DONE THAT THEN TRY SOME DEOXIDENT ON ALL THE POTS AND SWITCHES AND THEN BLOW THEM OFF WITH SOME CANNED AIR. HOPE THIS HELPS. JIMMY

Subject: [TS-520_820_530_830] Kenwood TS-520 Transmits, but no recieve.

Hey guys,

I just picked up a TS-520 to add to my shack and it seems that this radio has an issue. I am not sure if this was due to shipping or a preexisting condition, but the radio seems completely deaf. It does transmit, though I never gave it full power.

What would cause the lack of RX? The analog meter does not move, and I hear nothing from the speaker but a little crackle when I change bands. Same with headphones.

I have tried moving the function switch to the 25khz cal position and running the VFO through the band I do not hear the tone or see any needle deflection.

Any ideas?

Thanks Joe,

Appreciate the fast response and suggestions.

Tried this - and dried out the VFO a bit - it did have some residue left behind - but still had some wobbling on the VFO.

Ended up pulling VFO out of the rig, and pulling off the can to get at the wiper better to clean it up and lube the bearings - Works great now!

Thanks again.

73,

Brian N8TC

Thanks Robert for the suggestions.

Ended up pulling VFO out of the rig, and pulling off the can to get at the wiper better to clean it up, dry it out, and lube the bearings.

Shaft Wiper seemed to be the main culprit.

Just got it back together and it works great now!

Thanks!

Try working the JJY/WWV switch to clean the contacts. It will kill your receive if it's not making contact.

Yes it is. The radio also came with a DG-5 display and the frequency it shows matches where I have the bandswitch and VFO, so I'm pretty sure that is working. Also, the radio will transmit, I don't think it will do that without the VFO plug in back.

Any other ideas?

Thanks

I tried that and discovered something I can't believe I missed. This is a 520s not a 520. Just to try it, I did work the RF attenuation switch a few times. Still nothing.

I did try swapping the antenna relay with one from my 820s, but that did not help. This was more me testing the 820's relay than believing it would work. Oh well.

Thanks for the effort, any other ideas?

Topic: 41200 Message: 41200

It seems I am always looking for one more part or piece to complete my TS-520 station.

I need a TV-2/6 jumper cable to connect the 506 to the 502. I would settle for the two 12 pin transverter plugs. I'm sure I can locate an appropriate cable to use.

I am also looking for a non working TL-922 that I can repair a little at a time.

Thanks,

Rick / K5IAR

Well, I think a key point is that you hear nothing from the speaker at all except a crackle when changing bands.

This may sound dumb, but have you tried using a headset? I have two radios that have nothing coming from the speaker but work fine if you plug in headphones.

And a trick I like to use for troubleshooting is to open the case, and tune in another receiver to the IF frequency of the radio you are working on. If the sections before the audio amp are working you will hear the TS-520S received signals in the other receiver.

So tune in at 3395 KHZ and see how that works.

Good Luck!

Robert

I did try it with headphones and I still hear no audio. I also do not see any movement on the analog meter, this makes me think this is not just an audio issue. The meter does behave normally in TX, and it does move if I turn down the RF gain.

I have an 820s and an 830s I have used in the past, so while I am no expert, I am pretty sure I have the controls set correctly.

That is a good idea to try and listen to the IF, I'll work on trying that this weekend.

Thanks and 73's

Topic: 41206 Message: 41206

Hi All,

Wondering if anyone has a picture of their IF tap for the SM-220 in a TS-520S.

I am about to do it for my SM-220.

I don't know if I have any of the three post terminal things to add into it. I have larger ones and quite a bunch of them out of a Hammond organ I scavenged. I could offer a trade to anyone also with a pile of parts.

I'll probably use a chassis RCA on the rig since I prefer not to go out the connector pictured in the manual.

Thanks,
Archie (N3KVL)

41207. RE: TS820S now not receiving

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-01 17:01:21 UTC
From: Prof. Arnaldo Coro Antich
Topic: 41207 Message: 41207

Dear amigos:
This morning I opened up the rig and started to carefully disconnect the myriad of multipoint
connectors and spray the pins with a good quality spray.
Started by opening the top part, and after finishing that area, I ran a test and the rig
was with audio, receiving , but with the same problem with the VCO not locking PLL.
Then I proceeded to remove the bottom cover and extracted the relay, cleaned it
and sprayed the contacts. Also proceeded to carefully disconnect each of the multipoint
connectors , spray the pins and put them back in place.
Apparently something went terribly wrong , and now the rig is not working at all.
The meter in the receive mode went at first to the end of the scale... then after
fiddling with several of those connectors, it settled down to a lower point in the scale.
I do not have a printed circuit diagram, and it is very difficult to follow the wiring
by looking at the small computer screen here.
Any suggestions about how to try to isolate the fault will be much appreciated.
It seems like the VFO variable capacitor has a very unstable ground contact spring , so the VFO must be taken apart, something that seems to be quite a taske. The frequency counter is stuck on a set of numbers and only one digit, the last one seems to move.
As the possibility of obtaining a replacement transceiver locally are NIHL, all
efforts to bring this radio back to working conditions are going to be attempted.
I do not have an oscilloscope , and also no frequency counter. Only instruments
are a digital multimeter, a signal generator and an RF detector probe.
Maybe some of the list participants has developed ways to isolate defects on the
TS820 that may help to revive this rig that is of great value during the hurricane
season.

Ron,

Most of the voltages are printed right on the rectifier board itself...or, look at pg 11 of the service manual. I suggest that you power off rig...and unplug it.

Using a bright light and maybe some magnification...identify the locations that you want to test....some areas are a bit crowded...I have found that making
an enlarged drawing...with post/terminals marked...take measurements and place on your drawing for further/future reference.

  Be very careful poking around here...there is potential for +900VDC in this area...which can/will make you and SK!

Subject: [TS-520_820_530_830] TS-830S Rectifier Board voltages

Hi Guys and thanks for the time and effort that is spent to help us hybrid users. I have a ts-830s and would like to know what the voltages on the rectifier board should measure. Is there documentation on this somewhere? Thanks and 73's Ron KD0KPM

I would be happy with the TV 506/ 502. I had been looking for a couple for
a while, then I didnt have the cash when they did come around.

I'm not sure why my reply to this didn't show last night, but for the record the KEY terminal was loose. Soldering it back together solved the sidetone issue. Thanks Alan!

Regarding the loss of receive audio. When it happens if I tune to the 25 kHz calibrator I do not hear the tone. When the receive finally comes back I DO hear the tone, but while it's dropped out I do not hear it. I can still hear other stations in SSB, but I have to turn the volume up all of the way and even then it's barely audible.

I also tried keying the microphone several times. I can hear the relays clicking but I do not get any RF output while this is happening. Once the receive comes back everything works normal again. I also tried cycling the receive antenna switch. It has something wedged in to keep it "up" all of the time. I will take that out and see if toggling the switch makes a difference.

Oddly, once the radio has been on for a while this issue doesn't seem to happen at all. But it's really frustrating sometimes!

Thanks again for your help,

Tyler

One more observation. When the receive is out, if I put the mode to TUNE and the function switch to VFO, I can hear white noise just as normal. Any other combination of MODE and FUNCTION cause it to have no receive.

First, that relay on the bottom has an incredible ability to fall back out of its socket if the bottom case is not on nice and tight. You should check that.

As for the VFO, the process to remove and clean it is a bit involved, with a number of steps that must be followed in series, but it is really not difficult to perform. There are indeed screws in unexpected places that you have to locate and remove. K4EAA has a detailed series of photographs on his website that show how it is done. I followed his instructions when I had to remove and clean the tuning cap for my TS-802S and all went well - athough I will admit that the dial light quit working after that, the VFO started working fine. Given that it has a digital display, I do not consider the loss of the dial light to be of much concern; maybe I'll fix it one day when I run out of more important things to do.

Good luck!

Robert

hi Rick,

I used an older RCA audio cable as the jumper.

I have the 12 pin transverter connectors on ebay,
as well as HV capacitors.

please search for kenwood transverter.

I am looking into installing a pre-amp in my trusty old 830 for use in the higher bands..I have a 15 db Low noise less than 2db@30mhz wideband Mosfet pre-amp..Next question I want to install it inside the rig..Where would i hook it up?Coming off the rf board?relays somewhere?Any hints or advice would be appreciated.I know the 830 has a very good receiver..But i have 2 830's and just thought i would give my banged up one some experimenting just to see how effective it would be..I have already installed one in an ft-101 and wow it works great in it as i am much more familiar with it than the ts830..Thanks in advance..

This problem could be a little harder to track down. If you haven't done so already, make sure all board mounting screws are tight – loosen them up a little first and then retighten. If you have a quality spray contact cleaner such as DeoxIT D5, you could clean the MODE and FUNCTION switch contacts, followed by blowing them dry with compressed air, but I really don't think it is a switch contact issue.

Since you have already found one bad solder connection, it is very possible that there may another one that is temperature sensitive causing this problem. It is affecting both the receive and transmit functions so that narrows it down a bit.

I think I would concentrate on the RF, IF, and GENERATOR board connections. Using a hair dryer to warm each board a little might point you to the general area of the problem but you can't concentrate the heat well enough to really isolate the problem. Don't use a soldering iron for this since the rig will need to have power applied. ***The RF unit has dangerous voltages applied***.

Using an insulated tool such as a wooden popsickle stick, gently wiggle the wires at the soldered connections with the rig powered up. There could also be an issue with a component lead not making reliable contact but check the wire connections to the terminals first.

If this doesn't work, we will try something else. Also, there are other forum members with more experience on these rigs than I have, so feel free to jump in.

73,
Alan, KD5R

Subject: [TS-520_820_530_830] Re: ts520se sidetone question

One more observation. When the receive is out, if I put the mode to TUNE and the function switch to VFO, I can hear white noise just as normal. Any other combination of MODE and FUNCTION cause it to have no receive.

Rick,

  The lamp in question is behind the inner most dial...the one that's graduated....."0" "100" "200"...etc., it is just like the meter lamps. You can go about it two ways: From the top(top cover already off) remove the digital display tube...if any...you should be able to see the round rubberish lamp holder(use a bright light)...using a blunt tool...push down on the rubber holder...the holder and lamp should slid right off...it's more of a pain getting it back on. The metal holder is held in with a small screw...you should be able to remove that also...and get a bit more "wiggle room." Make sure that the bulb comes out enough through the slot to light up the dials. OR........

  you can remove all the VFO knobs & dials from the front...and get to the light that way. Not as scary as it sounds. If you can receive WWV, you can re-assemble
the dials etc to match the frequency...or use your digital readout...if your rig has one. You can also apply a small amount of your preferred lube at the VFO shafts
wear points.

  I have done it both ways...I prefer the latter ....as it give me a better view to inspect the gear train.

Rick,

  Hands still work good for me..just the ol' peepers...need some magnification at times. Some of those screws are very small...a decent
quality set of "phillips" & "regular" jewelers screwdrivers are a must. It can be a bit frustrating when putting the dial back together.
Note that the inner dial has a slot...about 25% of the bulb should protrude...adjust as necessary. the next dial has groupings of 1,2,3,4,5
the next or outer dial has the square hole where the first digit is. Pay attention to how these are set...at times it seems like your trying to
crack a safe combo..getting the right "group" to show through window.

holder and lamp should slid right off...it's more of a pain getting it back

on. The metal holder is held in with a small screw...you should be able to remove that also...and get a bit more "wiggle room." Make sure that the bulb comes out enough through the slot to light up the dials. OR.....

you can remove all the VFO knobs & dials from the front...and get to the light that way. Not as scary as it sounds. If you can receive WWV, you can re-assemble
the dials etc to match the frequency...or use your digital readout...if your rig has one. You can also apply a small amount of your preferred lube at the VFO shafts
wear points.

I have done it both ways...I prefer the latter ....as it give me a better view to inspect the gear train.

Subject: [TS-520_820_530_830] Pilot Lamps

I just acquired a TS-820 and it needs a little TLC. A couple of the pilot lamps are out and I want to replace them first. I see how to replace the meter light but do I have to remove the VFO to get to the dial light? Is there a dial light? I took the tuning knob and assembly off but still no access to a lamp of any kind. I am working from a Service Manual online until my hard copy arrives and I can't see lamps indicated for the dial much less how to replace them. Are they wheat lamps? Any all help will be much appreciated.

Tnx,

Rick /K5IAR

Subject: Re: [TS-520_820_530_830] TS-830S Rectifier Board voltages

Ron,

Most of the voltages are printed right on the rectifier board itself...or, look at pg 11 of the service manual. I suggest that you power off rig...and unplug it.

Using a bright light and maybe some magnification...identify the locations that you want to test....some areas are a bit crowded...I have found that making

an enlarged drawing...with post/terminals marked...take measurements and place on your drawing for further/future reference.

  Be very careful poking around here...there is potential for +900VDC in this area...which can/will make you and SK!

From: Joseph Stiles
Topic: 41205 Message: 41223

Ron,

You should have approx 140VDC on the "STB" post. My notes do not indicate the voltage for the "TUNE" post...but...with power on, heater switch on..measure voltage...it should be approx 200 or so VDC in send. It is not uncommon for Resistors 15 & 16...both 56k on the rectifier board to be way out of spec..or open.
This is one of the major causes of "no ALC in TUNE" complaint.

I can not remember if you stated prior, about the overall function of the rig? Does it receive good...bulbs/lamps, digital readout...etc...seem to function correctly...if so...the general health of the rectifier board is good. Have you tried to tune the rig up?? If not OK...as there are several voltages that are critical...especially the -C (minus C)...without this voltage present...and you turn on the heater switch...the finals will glow a real nice BRIGHT RED...
and destroy themselves and possible taking some other parts with them. The -C voltage should be approx -110 or so.
The voltages that are on the rectifier board are not "exact"...but should be close.

Be carefull "pulling the board." Most any repair can be done with the screws removed and the board GENTLY lifted and rotated to get access to
the foil side. When done...fully inspect ALL the wires/ wrap posts. Those wires have been in the same position for possibly 25 years...and have been
known to crack and break when angered ....just guess how I know.

I am not a repair expert...but I do have experience with some basic functions and problem solving with the 820/830....not 'cause I'm smart...just
been there and done that. I have received lots of help from members of this group in the past few years...and I 'm trying to return the favor.
As I stated...write it all down and keep it...you might just need it in about...oh...10 years.... hihi

Hello guys,

Here is an update on this thread I started a few months ago. That's right, I work when I can and when I can I work slow.....Forget everything they say about not replacing it if it is not broke. I have rebuilt the rectifier board and final board and replaced HV caps and screen and driver caps and all is back to manual specs. I suspect the small caps on the IF board were as much to blame as the HV caps. After 30+ years they all need retired. They did more than there jobs for all that time. Amazing! So, if you resurect any of these Hybrids or have trouble with that deal from Ebay, start at the beginning and at least recap before you start to check things out. Jim S taught me that.....I hope Yahoo does not eat this post like so many others. I want everyone to at least read this whether they agree or not. I have been redoing all my rectifier and final boards and I have 4 Hybrids on my bench waiting for their new guts. It takes awhile but I think you will agree it is worth it. NO MORE SHORTCUTS!!!!!!!!!!

73 all,
Don K5HFG

Thanks, Joe. I wrestled with it a while last night and finally decided I'd sleep on the situation and try again when rested. My main problem at the moment is the plate that has the slot in it. After changing the bulb I haven't been able to persuade it back in behind the front panel. It came out so I know it will go back I just have to find the combination. Thank again for all the help and advice!

Subject: Re: [TS-520_820_530_830] Pilot Lamps

Rick,

Hands still work good for me..just the ol' peepers...need some magnification at times. Some of those screws are very small...a decent quality set of "phillips" & "regular" jewelers screwdrivers are a must. It can be a bit frustrating when putting the dial back together.
Note that the inner dial has a slot...about 25% of the bulb should protrude...adjust as necessary. the next dial has groupings of 1,2,3,4,5 the next or outer dial has the square hole where the first digit is. Pay attention to how these are set...at times it seems like your trying to crack a safe combo..getting the right "group" to show through window.

Subject: Re: [TS-520_820_530_830] Pilot Lamps

Rick,

The lamp in question is behind the inner most dial...the one that's graduated....."0" "100" "200"...etc., it is just like the meter lamps. You can go about it two ways:
From the top(top cover already off) remove the digital display tube...if any...you should be able to see the round rubberish lamp holder(use a bright light)...using a blunt tool...push down on the rubber holder...the holder and lamp should slid right off...it's more of a pain getting it back on. The metal holder is held in with a small screw...you should be able to remove that also...and get a bit more "wiggle room." Make sure that the bulb comes out enough through the slot to light up the dials. OR.....

you can remove all the VFO knobs & dials from the front...and get to the light that way. Not as scary as it sounds. If you can receive WWV, you can re-assemble
the dials etc to match the frequency...or use your digital readout...if your rig has one. You can also apply a small amount of your preferred lube at the VFO shafts
wear points.

I have done it both ways...I prefer the latter ....as it give me a better view to inspect the gear train.

Don:

I have a TS-520 that has a fried - as in smoking - power supply section. Given that I decided that I had no choice but to replace everything but the transformer.

But as this effort progesses and I am in the process of recapping the power supply, I am astonished to find that I have not found a single HV cap that does not hold a charge very well after I removed it. And one of them - a 100mfd 500V - was so smokey looking I just knew it was bad. Admittedly, I do not have a cap tester and I just charge them up with a suitable voltage and observe how quickly they decay - but they all look pretty good.

You are right though - better be safe now than be confused forever.

Good luck!

Robert

Thanks, Joe. I wrestled with it a while last night and finally decided I'd sleep on the situation and try again when rested. My main problem at the moment is the plate that has the slot in it. After changing the bulb I haven't been able to persuade it back in behind the front panel. It came out so I know it will go back I just have to find the combination. Thank again for all the help and advice!

Subject: Re: [TS-520_820_530_830] Pilot Lamps

Rick,

Hands still work good for me..just the ol' peepers...need some magnification at times. Some of those screws are very small...a decent quality set of "phillips" & "regular" jewelers screwdrivers are a must. It can be a bit frustrating when putting the dial back together.
Note that the inner dial has a slot...about 25% of the bulb should protrude...adjust as necessary. the next dial has groupings of 1,2,3,4,5 the next or outer dial has the square hole where the first digit is. Pay attention to how these are set...at times it seems like your trying to crack a safe combo..getting the right "group" to show through window.

Thanks, Joe! I'm sure glad to hear I don't have to remove the entire front panel or the VFO. I think I'll take your second method since I'm already half way there. I'll let you know how it goes. My old hands and fingers are not a nimble as they once were, but I'll give it a shot.

Subject: Re: [TS-520_820_530_830] Pilot Lamps

Rick,

The lamp in question is behind the inner most dial...the one that's graduated....."0" "100" "200"...etc., it is just like the meter lamps. You can go about it two ways:
From the top(top cover already off) remove the digital display tube...if any...you should be able to see the round rubberish lamp holder(use a bright light)...using a blunt tool...push down on the rubber holder...the holder and lamp should slid right off...it's more of a pain getting it back on. The metal holder is held in with a small screw...you should be able to remove that also...and get a bit more "wiggle room." Make sure that the bulb comes out enough through the slot to light up the dials. OR.....

you can remove all the VFO knobs & dials from the front...and get to the light that way. Not as scary as it sounds. If you can receive WWV, you can re-assemble
the dials etc to match the frequency...or use your digital readout...if your rig has one. You can also apply a small amount of your preferred lube at the VFO shafts
wear points.

I have done it both ways...I prefer the latter ....as it give me a better view to inspect the gear train.

Subject: [TS-520_820_530_830] Pilot Lamps

I just acquired a TS-820 and it needs a little TLC. A couple of the pilot lamps are out and I want to replace them first. I see how to replace the meter light but do I have to remove the VFO to get to the dial light? Is there a dial light? I took the tuning knob and assembly off but still no access to a lamp of any kind. I am working from a Service Manual online until my hard copy arrives and I can't see lamps indicated for the dial much less how to replace them. Are they wheat lamps? Any all help will be much appreciated.

Tnx,

Rick /K5IAR

41236. KENWOOD HYBRID USER NET (March 3rd, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-03 21:02:22 UTC
From: mvgilger
Topic: 41236 Message: 41236

The Saturday's net on 40 meter we had 40 stations checking with good band conditions. There were 5 new stations checking in. Out of those, there was:

9 running TS-520(x)
4 running TS-530(x)
3 running TS-820(x)
5 running TS-830S
0 running a set of 599D Twins

I was running my TS-830s. The rest were running non hybrids of one model or another.

Tom, WB0SGA tried calling the Sunday 20 meter net, but decided to call it off due to QRM being generated from the contesters. Hope next week is better .

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 93, Sunday's total = 87
February 2013, Saturday's net total = 103, Sundays total = 87
March 2013, Saturday's, net total = 40, Sunday's total = 0 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

We've a major problem here on the Left Coast. A very powerful jammer that is wreaking havoc on all sorts of nets on 75 and 40 meters. It is so bad, the RV Net has created a $300.00 bounty to who finds (and can prove) who the jammer is. We DO know it is the same person everywhere...His M.O. is exactly the same. It really hurts the lower power operators, those of us with horsepower can usually blast right through him. If I caught him, I would be tempted to just jam his fingers in the high voltage section of his radio and hold him there until he stopped twitching...but...you know, the last time I checked, murder was illegal, even if the murderer was contributing something good to the community.

Topic: 41240 Message: 41240

Hi All,

My TS-830S has developed a problem where the RX audio is very low with the RF and AF gains turned fully clockwise. I can hear stations clearly, just at a very reduced audio level. The S-meter shows that the signals are very strong so I don't suspect the receiver front-end. For example, one European station is regularly +10 to +20 on 40 meters and is still that strong with this new problem.

Suspecting the audio amplifier I replaced the audio amplifier IC(HA1368R)and the problem persists. I then checked all of the DC voltages in the audio circuit on the AF-Unit called out on the service manual schematic and they all checked out.

Rather than shotgunning more parts I thought it best to ask for some direction in locating and fixing this problem. Has anyone ever seen this problem before? Any tips on how to diagnose the cause are greatly appreciated.

To explain a bit better.
The output of the audio Amp is first send to the Phone socket, then to the external speaker socket and last to speaker itself
These are all in series.
If no Headphones or external speaker is connected then audio appears at the internal speaker itself.
However if the phone socket contacts are dirty, or faulty, or the external speaker socket is dirty or faulty no audio or little audio will get through to the speaker.
Dirty contacts present a high impedence to a signal.
First clean the contacts on the phone socket and external speaker socket and see what happens.
Ofcourse the internal speaker may be faulty as well but highly unlikely

Regards

And a bit more.
Connect a set of heaphones to the phono socket.
If full audio there then connect a external speaker to the external speaker socket.
If full audio is there you have a problem in either or both sockets (dirty)
If no audio on the headphones I am affraid it is back to trouble shooting the audio stages.

Subject: [TS-520_820_530_830] TS-830S very low RX audio

Hi All,

My TS-830S has developed a problem where the RX audio is very low with the RF and AF gains turned fully clockwise. I can hear stations clearly, just at a very reduced audio level. The S-meter shows that the signals are very strong so I don't suspect the receiver front-end. For example, one European station is regularly +10 to +20 on 40 meters and is still that strong with this new problem.

Suspecting the audio amplifier I replaced the audio amplifier IC(HA1368R)and the problem persists. I then checked all of the DC voltages in the audio circuit on the AF-Unit called out on the service manual schematic and they all checked out.

Rather than shotgunning more parts I thought it best to ask for some direction in locating and fixing this problem. Has anyone ever seen this problem before? Any tips on how to diagnose the cause are greatly appreciated.
73,

Jon KR5C

Jon,

Have your tried the relay on the audio board?

As Dave said, check the relay on the AF Unit board. You can do that by lightly tapping on the relay's cover with a wooden pencil or plastic rode. Don't simply "visually inspect" the relay, as many hams tend to do, that won't tell you anything about the relay. If tapping on the relay cover results in changes in the audio then I suspect the relay is bad and should be replaced. The relay on the AF Unit board has been known to be the source of numerous problems in the 830 as well as other Kenwood transceivers, see Ken, K4EAA, website link below for details.

This weekend I spent some more time on the radio and cleaned switches with deoxit, and still nothing. I did try listening with another radio to the IF frequency as Robert suggested, but I did not hear anything from radio I was using to listen with.

Desperate times call for desperate measure, so I started reading the *gasp* service manual.

Right now I am looking at the troubleshooting flow chart and was planning on following that. The first step in the no reception is to check the speaker, which I have. Next it say to check Q3 and Q4.

Forgive my ignorance, but what is the best way for me to check the function of these transistors?

Thanks for the help guys,

73's

41251. TS820 Freq readout

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-04 23:56:48 UTC
From: wallydoc
Topic: 41251 Message: 41251

TS820 freq readout problem
I am having trouble getting the freq readout to be correct on all bands. When I center it on 20MHz, it it off by 400 (.4, last digit) on 7MHz band and about the same on 14 MHz.
Does anyone have any suggestions? Perhaps I am forgetting something.
I did rebuild this unit and think I got all the adjusts correct.
The radio works quite well otherwise.

The volt readings are not exact, but a reading of 0 would indicate there is a bad component. Look at the resistors on the board, I'll bet one is open. Just measure them in place.

Michel,

Thanks for the reply. I forgot to include part of my diagnostic process. I have the same low audio level at the phones jack, external speaker and internal speaker which is why I took the covers off and started into the AF-Unit. I was hoping that it would be something simple like the phones jack. No such luck! On to the relay.

I replaced the relay on the AF board on my TS 830. I would highly suggest you replace the relay before doing any other trouble shooting. Very good chance it will fix your problem.

Hi Jon,
Yes you had not stated that you allready had checked the audio output ports on the back of the radio.
In good trouble shooting proceedures, one allways works backwards, never forward.
Hence my suggestion to you.
I hope you find a new relay will sort out your problem
The upside is you have a spare audio amp to put on the shelf .
Regards,
Michel vk3kvw

Michel,

Thanks for the reply. I forgot to include part of my diagnostic process. I have the same low audio level at the phones jack, external speaker and internal speaker which is why I took the covers off and started into the AF-Unit. I was hoping that it would be something simple like the phones jack. No such luck! On to the relay.
73,

Jon KR5C

I don't have the radio in front of my, but I do not believe the 520s has a relay on the AF board. I'll double check when I get home.

I have tried swapping the antenna relay with one from my 830s and it made no difference.

Greetings group,

There is no relay on the AF board. There are two relays....one is hidden under the "VOX BOARD," the other is next to the "final board" under the metal
shield. The first is a bit difficult to get to as the VOX BOARD needs to be unscrewed and tilted up/out of the way...the second...is easier.

Be sure to check the connections of the two little black Coaxes on the
left side of the radio.
I think they went to the NB board. It is just under the VOX unit if I
recall.
It has been a while since I worked on a 520, but I do recall a bad
connection on either of those will do what you are talking about.
I wish I had one in front of me at the moment.

Wally,

Please clarify some of the statements you made:
"Centered on 20Mhz?" do you mean 20 meters? what does "centered" mean?
The 820 has a VCO...voltage controlled oscillator. I have seen VCO's correctly adjusted..according to the service manual...either for voltage or,
frequency, and still vary slightly from band to band.

What are you using to monitor frequency? You do not state if the 820 has a "digital readout." Some 820's came without it...but were added later.
Some came from the factory with it already installed......the 820S.

What was rebuilt?

TS820 freq readout problem
I am having trouble getting the freq readout to be correct on all bands. When I center it on 20MHz, it it off by 400 (.4, last digit) on 7MHz band and about the same on 14 MHz.
Does anyone have any suggestions? Perhaps I am forgetting something.
I did rebuild this unit and think I got all the adjusts correct.
The radio works quite well otherwise.

From: Mike
Topic: 41251 Message: 41262

The VCOs by themselves have an initial alignment adjustment shown in the 820 service manual.

During normal operation the PLL Unit's "PD" (Phase Detector) make any/all necessary adjustments to the PLL Unit's band switch selected VCO by applying a small DC voltage to the VCO.

The VCO signal is used in both transmit AND receive. Therefore, if the PLL Unit changes to an "Unlock" state, the VCO signal applied to the RF Unit's "VCO" terminal will be missing resulting in no transmit and no receive.

This is explained and shown on page 10 in the 820 service manual.

I had a chance to tap on the AF-Unit's relay cover this evening with a plastic ruler. It made absolutely no difference in audio quality or volume. Does that mean that the relay is definitively not a problem or should I consider replacing it as a preventative measure?

If not the relay, where to look next? Could the other circuitry connected to the audio amplifier output be heavily loading the signal? I thought about temporarily pulling the electrolytic just past the inductor to see if something after it is loading the output. Thoughts?

Joe,

Yes, I have already placed an order with Jim for an new relay and one of his recap kits. I see some swelling on the underside of the HV caps and, while the HV isn't sagging yet, it is only a matter of time.

Once I got the radio hooked up to my antenna (MFJ-1796) my first contact was with a guy in Arkansas, he reported a good strong signal but my audio was a little off. Once I finish recapping everything I need to learn how to do an alignment. Then I'm sure this little rig will give me years of service.

Thanks again to Joe and everyone else for helping me stumble through this.

Joe:
Sorry,
I centered (adjusted dig readout)it at 29MHz using a fluke sig gen, which I believe is quite accurate.
After that dig readout is a little off on other bands when I put in other signals.
Wally
KC9INK

Wally, how are you determining the accuracy of the signal generator?
Have you connected a frequency counter in parallel with the signal
generator's output?

41270. Re: [TS-520_820_530_830] Re: TS820 Freq readout

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-07 01:18:48 UTC
From: Mike
Topic: 41251 Message: 41270

There are individual PLL Unit "VCOs" for each band, including JJY/WWV. Adjusting the 29.0Mhz 10 meter VCO will not affect the other band VCOs or have any affect on the other band VCO accuracy.

There are also individual PLL Unit HET crystals for each band, including JJY/WWV. If a HET crystal ages resulting in a change in its frequency, then that crystal will affect the HET oscillator frequency on that band ONLY.

The VFO tuning frequency range is between 5.500Mhz and 5.000Mhz, regardless of the band selected/in use. If the VFO output frequency "drifts" for what ever reason then the PLL Unit's "PD" will notice the "drift" when it compares the VFO signal against the CAR Mixer signal. If there is any difference during the PD's comparison, the PD will adjust the VCO until the VFO signal AND the CAR Mixer signal are the same. A simple example is shown below. We will assume the VFO knob was adjusted slight up in frequency from zero on the dial to the 5Khz tick mark. This results in the VFO frequency to be 5.495Mhz.

VFO output is 5.495Mhz
CAR Mixer output is 5.500Mhz

PD comparison of the 5.500 and 5.495 results in 5Khz difference.

This results in the PD issuing a VCO adjust DC voltage to the VCO in use until the comparison between the VFO AND the CAR mixer signals are the same. At that point the PD ceases adjusting the VCO in use. The VCO output frequency at that point is slightly different than it was BEFORE the PD issued the change to the VCO. The digital display will also change, display the NEW operating frequency.

Any change in the VFO setting or the RIT setting will result in the PLL Unit's PD changing the VCO until the VFO and CAR Mixer signals are the same AND the digital display will update it's display showing the "new" frequency. In transmit, the RIT is "disabled" so the digital display WILL change.

What do you mean when you said

"I centered (adjusted dig readout)it at 29Mhz...."?

The only adjustment the digital display has is the standard oscillator, typically referred to as the digital display reference oscillator. Once this adjustment is made, it has no affect on the accuracy of each individual band's VCO.

Good morning everyone,

I have recently purchased a R-820 to hook up to my TS-820s. It came with a VFO spinner knob, but the plastic or Bakelite part has a little crack. I tried to disassemble it in order to repair it and at the same time to polish the aluminium round part. The spinner is very easy to disassemble just unscrewing the little screw at the back of the knob. The question is, does anyone know how to take out the round aluminium piece from the plastic part?. I hope you can help me. Many thanks and kind regards to all.

Carlos,
EA1XF

Unfortunately, the "best" place would have been on ebay a week or so ago when one sold for $20, not including shipping.

But I can vouch for Gary. I recently bought a tuning cap for a National receiver from him and he is utterly trustworthy.

Good Luck!

Robert

Carlos,

  I do not know if it can be safely removed. I have never attempted it. If you want to "polish" it, I have used some regular old toothpaste and a soft bristle old toothbrush or similar...it's amazing what it will do. Plus it might prevent future cavities...and leaves a fresh "minty" scent... hihi

Hi Joe,

Thank you for your reply. That´s a good alternative to my original idea of trying to separate both parts. I will give a try but I still need to repair the crack. Maybe someone brave has done it before or tried to do it and can let us know his experience with this.

I love these Hybrids and I am now in the process of restoring this receiver, which are not many around specially at this part of the world. Then I want to hook it up to my TS-820s and use them like the Twins, which are another beauty.

73 to all the group and I will keep tuned to see if we have some more feedbacks about this matter.

I have used a toothpick to hold the crack in a knob open a little bit. Then I use another toothpick to apply a tiny dab of glue in the crack. Then remove the first toothpick.

As for cleaning the metal skirts, I wash knobs in dishwashing soap and water. I used a toothbrush to clean them. If this doesn't clean the metal I use rubbing alcohol and a cotton swab. One of my friends uses lemon juice to clean the metal and says it works well.

41280. Contest usage of analog rigs with N1MM logger

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-07 23:19:07 UTC
From: bpierfel
Topic: 41280 Message: 41280

I participated in the ARRL DX SSB contest on a casual basis with my TS-830 and it worked out just fine. I used the excellent N1MM logging program in a manual frequency entry mode. I quickly missed it's ability to converse with my TS-570 and automatically log the frequency. I thought about digging into my 830 and extracting frequency info for automatic entry into N1MM logger but came up with a cleaner solution usable on any older rigs. I have a pic processor doing frequency counting (with a pre-scaler & attenuation!) connected to the 830's output. It only reads the frequency on transmit and then the pic emulates a TS-570's serial output and sends the data to a laptop via serial data (I used the TS-570 data format as I own one and decoded it's output) N1MM logger shows the hybrid rig's frequency for logging. Voila; automatic frequency logging with a superb contest rig. My question for the community is whether anyone else would be interested in the schematic, etc. when I get things cleaned up. Would you pay say $10 for a programmed pic?
The caveats are that the frequency resolution is limited to 10 kHz as the counting needs to be very fast for CW and SSB. SSB counting is flaky so far but logs the contact to at least the correct band.
Any interest?
Bob

41282. TS-820 drive problems

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-09 03:33:06 UTC
From: Rick
Topic: 41282 Message: 41282

My newly acquired TS-820 has a quirk I have yet to solve. I thought I would see if someone who has been around these fantastic hybrids longer than I could enlighten me.

When I first turn on the rig I have no drive on any band. I have all the controls set properly (as per manual). I have tried three known good sets of 6146B's and 12BY7A's none of which changed the problem. After 15 or 20 minutes I get a little output into my inline watt meter but still no drive indication on the 820's meter. I am able to load the transmitter at that point but to a reduced power output, of course. This condition slowly gets better as time passes. It takes a full hour (sometimes longer) before the drive becomes normal and all is well. The rig then becomes very stable (power wise) and has an output of about 100 watts on 14.250 MC. I have tried this into a dummy load as well as an antenna, not that I think it would matter. I did find that the two electrolytic capacitors on the power supply board were well out of tolerance and replaced them. This did not help the problem at all. The voltages at the 6146's are all normal as are the voltages at the 122BY7A.

Any ideas?

Thanks for any help or advice you can offer.

The S-meter shows that the signals are very strong so I don't suspect the receiver front-end. For example, one European station is regularly +10 to +20 on 40 meters and is still that strong with this new problem.

Hi Jon,

I usually avoid posting here so as to avoid conflict with the regular experts, however seeing as you're still stuck ...

I've seen C24 on the A/F board cause exactly this problem. If you have any means of injecting an audio frequency signal of not very much voltage you could poke a signal in either side to confirm it., otherwise just replace it and see.

Another obvious candate is C34, but I've not seen a failure there ..

You're welcome to contact me off forum if you need further assistance.

Regards

Adrian - ZS1TTZ

41285. Help - ALC meter and S meter readings high

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-09 15:02:11 UTC
From: dchristensen70
Topic: 41285 Message: 41285

I have a TS-830S that has developed a problem with the ALC meter (and I think S meter) reading. With the radio in tune mode and the carrier control fully counter clockwise the ALC meter reads in the middle of the range. Advancing it even slightly (beyond the 8 o'clock position) pegs the meter making it hard to peak the drive. When tuned and transmitting in SSB the ALC meter pegs with almost no power being generated.

I noticed the other night that S-meter readings appear to be quite high when compared with another radio - normal signals are 20-40 db over S9.

This might have happened when I had a bad section of coax that was presenting a high SWR to the radio on transmit.

The HV meter setting seems normal, the IP Bias on SSB transmit is normal (60 ma), the RF meter setting seems to track an external meter. Just the S-meter and ALC is off.

Thanks and 73

Dave - KD7UM

Hi.
I have same problem on my ts 820s.
Strong birdie on 21200 mhz that can be
Received also other rx.
I worked on rf unit but is ok.
I can believe that can be the pll unit.
I have read other post but i din't found a solution.
Anywsy also on 28 mhz same matter.
Thanks for any other new.

Ohm out the cathode resistors on the Final Board...
You should see 5 ohms from the two cathodes to ground...
These resistors act as a fuse & do change value with time...

41290. TS820 CW Frequency Shifting when Transmitting Question

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-10 04:45:57 UTC
From: stever1k
Topic: 41290 Message: 41290

I have an 820 that I recently brought back to life and I notice that when I transmit in CW the display will shift 700HZ from say 7.055.0 to 7.055.7...Is this normal to be 700 hz higher on transmit? Or do I have a problem someplace that needs attention.

Steve NU0P

41291. Re: [TS-520_820_530_830] TS820 CW Frequency Shifting when Transmitting Question

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-10 15:16:38 UTC
From: Mike
Topic: 41290 Message: 41291

Steve,

Yes, that's normal.

The 820 receives CW using the CAR Unit's "USB" crystal frequency 8831.5Khz then switches, in CW and TUNE mode transmit, to the CAR Unit's "CW" crystal frequency, 8830.7Khz. If you do the CW/TUNE CAR Unit offset simple math (see example below), you will see that using the CAR Unit's CW/TUNE crystal frequency, in CW/TUNE transmit, that the transmitted RF carrier is offset by "800Hz".

8831.5 - 8830.7 = .800

The 3 separate CAR Unit crystal frequencies are as follows (discussed/illustrated in the 820 service manual which I recommend you taking some time to read):

LSB - 8828.5Khz
USB - 8831.5Khz
CW(T) - 8830.7Khz

If the 820 simply kept using the USB CAR Unit frequency, 8831.5Khz, in CW transmit then the distant end station would not hear your CW signal because it would be zero beat at his/her end. Therefore, by "offsetting" the CW transmit carrier signal by 800Hz (switching to the CW CAR Unit crystal) but NOT changing the distant end receiver, the distant end station will hear a "beat note" in his/her speaker (see anther simple explanation below).

The Kenwood TS-820, and other hybrids, are not the only transceivers/transmitters that use this method, Heathkit, for example, does it in their HW-100, HW-101, SB-100, SB-101. SB-102, SB-400, and SB-401 transceveivers and transmitters. There are slight differences but the "idea" and "outcome" is the same. The USB Carrier Generator's crystal is used as the receiver's "BFO" (Beat Frequency Oscillator) to hear the beat note. Switching to the CW Carrier generator crystal for CW transmit allows the distant station to hear a beat note he/she would otherwise NOT hear if the transmitter did NOT switch CAR Unit crystals.

This is shown and explained in the 820 service manual. It's slightly different in the 530/830 but the "idea" AND the "outcome" is the same. Look at it this way, if you tune a receiver to 1.234Khz then transmit an RF carrier at the same 1.234Khz, you would NOT hear a beat note. Now, "Offset" the "transmit" carrier by a few hundred hertz and, BINGO, you hear a "Beat Note".

Again, take some time and read the Circuit Description section in the manuals, there's a lot of valuable information about how your 820 works in that section that can answer a lot of your questions.

Ciao Dave.

Well just to informe that i have checked other section but all is after injection simulation.
The signal is very strong and you can ear also in other receiver.
I believe starting from PLL section or CAR assy.
To day i will check with another PLL and CAR.
In my radio repaire experience i never found something like that so strong like a HP generator.
Another problem solved is on RIT and frequency stability solved by change the complete set of very old pot on AFAVR unit with multi-trim pot and now is working very fine and stability is 100% immediatly.
Anyway hope to solve the problem because if you connect ext vfo the signal rise more.

Pete,

A bit more information is needed: is the rig in "tune" mode? and, what position is the meter selector switch in when you get this problem?

If not familiar with or, tuning up these rigs, I suggest that a review of the procedure in the "operator/owners" manual.

The "bias" control by not be set correctly...the "RF volt" control on the rear may not be set correctly(this does not affect RF output...just the meter reading)

41296. KENWOOD HYBRID USER NET (March 9th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-10 18:59:20 UTC
From: mvgilger
Topic: 41296 Message: 41296

The Saturday's net on 40 meter we had 28 stations checking with good band conditions. There were 3 new stations checking in. Out of those, there was:

6 running TS-520(x)
2 running TS-530(x)
5 running TS-820(x)
6 running TS-830S

I was running my TS-940s. The rest were running non hybrids of one model or another.

The Sunday's net on 20 meter we had 18 stations checking with good band conditions. There were 3 new stations checking in. Out of those, there was:

4 running TS-520(x)
0 running TS-530(x)
3 running TS-820(x)
4 running TS-830S

I was running my TS-830s. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 93, Sunday's total = 87
February 2013, Saturday's net total = 103, Sundays total = 87
March 2013, Saturday's, net total = 68, Sunday's total =18 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

I need an external VFO for my Kenwood hybrid. I was trying to contact the Clipperton DXpedition but could not move up 5 khz using just the RIT. I have a 520s and an 820s (and looking at an 830s). Which of the external Kenwood VFOs are compatible with these rigs? I see VFOs for sale but don't know about compatibility.

Hi Joe and thanks for the reply. The rig is in "tune", the Meter switch is in "ALC". That does indicate that the rig comes to resonance but the meter pegs right. I did check and the idle current is 60 ma. I have two manuals and one indicate the current should be 50 ma while the other calls out 60. I haven't adjusted the RF-volt control but will read the manual for it's setting.
Thanks & 73.

Subject: Re: [TS-520_820_530_830] Meter indications.

Pete,

A bit more information is needed: is the rig in "tune" mode? and, what position is the meter selector switch in when you get this problem?

If not familiar with or, tuning up these rigs, I suggest that a review of the procedure in the "operator/owners" manual.

The "bias" control by not be set correctly...the "RF volt" control on the rear may not be set correctly(this does not affect RF output...just the meter reading)

Pete,

  I need to get out my 520 manual and look at the circuit. Since this rig appears new to you..and it seems to have some malfunctions/problems,
may I suggest you check out the value of the "screen" & " cathode" resistors. It's been a bit since I have poked around the 520 but, I'll assist
to the best of my knowledge/experience.
I suggest that you set the "Ip" at the low end for now as, I do not know what finals you have. The original 2001A's were usually set for 60mA,
some replacements...6146B...6146W may require different settings...it really won't hurt to set for 50mA.

Does the "CAR" control have any affect with mode switch in "TUNE" & meter select switch in "ALC" and rig is put into transmit?

Hi members;
I am looking for the service manual of this nice peace of equipment for a repair.
I already could find the user manual on the net but the service manual seems to be a problem to obtain ?
Perhaps someone has a example in pdf format on the desk.
I like to receive a copy,if it will be possible for someone ?

My e-mail : on4aef@...

Kindly regards Jean ON4AEF.

Thanks Mike

An excellent explanation. While I was aware of the mixing that has to take place in order to hear the signal I was not aware of how display was designed to show this. As you are aware not all radios chose to use this design approach.

But now at least we can be confident that another fine radio was saved from being parted out or placed in a dumpster. I hate seeing that happen. These radios are such fine pieces of engineering.

Thank you again for your help

kc2mru,

Not to over simplify, but do the following: power up rig, turn "heater" switch ON, "SG" switch to ON...it's on the rear panel.. mode switch to either USB or LSB, meter select switch to "IP," flip "send/rcv" switch to "send." You should see no more than 60mA reading on the meter.

Make sure that you are either connected to a dummy load or suitable antenna...dummy load preferred.

If you are not familiar with tuning tube type rigs...may I suggest that a couple of "dry runs" may be in order...ie..location of needed controls...etc.
The final amplifier tubes can be harmed, as some other components.. by being operated out of tune/resonance for extended time periods.

You can go to Ken Kemski's web site k4eaa.com he has some very good info/instructions for the beginning tube rig "tuner."

Subject: [TS-520_820_530_830] "Plate Idling Current" for a Kenwood TS-820

I recently bought a nice little TS-820 from another Ham , but I haven't messed with it alot yet . I finally got around to tuning it up so I could try and talk on it . I read the directions in the manual , but at the risk of sounding dumb , for some reason I'm not getting any reading on the meter when attempting to check the Plate Idling Current , even when I attempt to adjust the rear panel bias control ... am I over looking something , or is there a deeper problem , like maybe a repair needs to be done ?

Is there anyone else that has experienced this problem that can help me out with this ?

Thanks

I have a Kenwood TS-520s that I have just gotten back on the air thanks to this group. One of the things I noticed in reviving this radio was the caps in the power supply have started to bulge. I ordered a kit from Jim (KE7OAY) over at hybridrestore.com to go ahead and recap the whole thing.

My current plan is to start with the power supply first, then go and replace them one board at a time. I don't see how it would matter, but is there any order I should work in?

I pulled the IF (X48-1150-00) card out of my TS-820 to examine it thoroughly and clean all the contacts. I "assumed" the connectors were all butted against each other and would go back easily. I assumed wrong. There are 2- 3 pin connectors. One of them fits the 3 pins between two larger connectors. The other one, however, fits on 3 of 5 possible pins. From looking at the schematic it appears to me it would have to go on the middle (numbers 2, 3 and 4) pins, BUT I don't want to take a chance on it. I know it's a rookie mistaken not to take a picture of the board prior to removing the cables or at least write down any situations like this. After 50 years of working on radios you'd think I would have learned that! This is on the socket labeled "IF2" and is sandwiched between a 7 pin socket and a 17 pin socket. If, by chance, anyone has their TS-820 open or has the knowledge of where this 3 pin plug goes please let me know.

Thanks for the bandwidth and sorry for the long explanation.

You can often tell if a cap is getting hot due to leakage current.
Replace those first, as they are probably going to be the first to
fail. Don't touch them with power applied, they could have voltage on
the cans, and could be hot enough to actually burn your skin ! Don't
wait too long to replace all of them that are bulged out, and it
wouldn't be a bad idea to just do them all!

Ah, I well remember that socket! When I bought my TS-820S it had a whole lot of things wrong with it, but as I fixed them and got it working to a degree, I wondered why in the world that it would transmit SSB but not CW. I did not see how that was possible.

It turned out that you have to place that socket in one position if you have a CW filter and another if you do not. This is not mentioned at all in the Service Manual but is in the Operating Handbook.

Good luck!

Thank you, Robert. I did not know that fact. You□re sure right about no mention of it in the Service Manual, but there it was, pretty as you please, in the Operators Manual. I decided I didn□t have it right after all and changed it to option □B□. It works great from there. I wish I could say that solved all of my problems, but I still have some other issues to work through. When I turn on the processor I lose more than half of my RF out. I read online that this is usually due to a defective Q30 transistor on the IF board. I□ll check it tomorrow. Hopefully, that will cure the processor problem and the fact that my meter needle lacks about a ¼□ going all the way back to zero. This little gift about the needle just sprung up yesterday when I turned it on. Nothing like a good surprise! HI HI.

Thanks again,

Rick / K5IAR

BRIAN THIS IS MY ADVICE TO YOU. REPLACE THE HIGH VOLTAGE CAPS YES BUT I WOULD NOT START REPLACEING ALL THE CAPS IF THE RIG IS OPERATING OK AFTER U REPLACE THE H.V. CAPS YOU COULD FIND OUT THAT CAN CAUSE U MORE PROBLEMS THAN U WANT TO DEAL WITH. THIS IS JUST MY OPINION IAM ONLY TRYING TO HELP U. I HAVE A 35 YEAR OLD 520 AND I HAVE NOT REPLACED ANY CAPS AS OF YET. JUST DONT WANT TO SEE U MAKE A LOT OF UNNESSATY PROBLEMS FOR YOUR SELF. HOPE THIS HELPS JIMMY.

Subject: [TS-520_820_530_830] Kenwood TS-520s re-cap question.

I have a Kenwood TS-520s that I have just gotten back on the air thanks to this group. One of the things I noticed in reviving this radio was the caps in the power supply have started to bulge. I ordered a kit from Jim (KE7OAY) over at hybridrestore.com to go ahead and recap the whole thing.

My current plan is to start with the power supply first, then go and replace them one board at a time. I don't see how it would matter, but is there any order I should work in?

I do not see how re-capping a 520 can cause problems as long as they are replaced with the correct value caps. I have also just ordered full re-cap set also for one of my 520s, from the Hybrid Store.

I have done this on the past on a 530s and had no problems. I see no reason to do them in a specific order
after you have done the HV and power supply caps first.

Keith,

Another vote for leaving it alone if it's working. I just restored a TS-520 and replaced a lot of caps and one of the problems I ran into was having slivers
of solder from the desoldering tool I was using get into the boards. I was lucky enough to be able to blow them all out with my compresser and air chuck
but having one lodge somewhere could have ben devastating. It's really hard to clean the solder off the old boards so you can do a proper component
replacement and resolder with a pencil iron.

Hey Joe,
Thanks for the reply ... I've followed the procedure as it was described in the manual . Then I tried the procedure that you told me to do , and then I tried it the way that "k4eaa" said to do on his site ... and no matter which one I'm trying , I'm still not getting a reading on the Plate Idling Current . It would possibly be something like a weak tube would it ?

Thanks,
Del

41318. 820S power transformer replacement

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-13 02:45:07 UTC
From: Kevin O'Dell N0IRW
Topic: 41318 Message: 41318

I came into possession of an 820S the other day. It didn't have the tubes in it, no final cage, no power plug, no fuse and only about 3 screws holding the case together.....but otherwise seemed clean. I got a power connector and built the power cable. Built a final cage out of roof flashing (LOTS of holes drilled). Got the 4 mm screws at the hardware store for the case. Got a new 12BY7A driver at a hamfest this past weekend. A matched pair of Taylor 6146B's will arrive tomorrow from RF Parts. 6 amp 3AG fuses will also arrive tomorrow from Mouser.....So, this afternoon with a 5 amp fuse in the holder I plugged it in and flipped the switch.....all the lights came on as did the display. It had a LOUD 60 cycle hum in the audio and after about 45 seconds or so, there was a frying sound and some smoke started coming out of the rear. I powered down and unplugged. After waiting about 30 minutes, I pulled the covers and flipped it on its top....plugged back in and turned it on again...after the requisite 30 or 40 seconds the frying started and the smoke came out from under the windings of the power transformer...Upon closer inspection, the wires from the power plug have been hot before. So, I obviously have a problem in the power transformer. I have located a replacement (same part number) transformer and have ordered it. The next question is what is causing the transformer to fail.....bad caps, or what?? Also, what is the proceedure for changing out the transformer??

thanks and 73,

Kevin O'Dell, N0IRW

Del,

I am going to assume that the meter and the selector switch works in the other positions.

I am going to have to dig out my schematic and look...but check this: with rig OFF and power cord UNPLUGGED...let it sit for a bit...your going to be poking close to 800+ volts. Let the capacitors drain....remove the top and bottom covers...be careful of the speaker wire. Turn rig upside down...and look at the final amplifier board...find the 2(two) 10 ohm, 1 watt resistors on the board...there the biggest ones there. With a VOM/DMM measure them to ground....they are in parallel...so should be close to 5 ohms...closer to 5 ohms the better...anything higher indicates one or both are high in value or one is open. While your there..check the 2(two) 100 ohm 1/2 watt resistors...they should be 100 ohms +/- tolerance.
A weak tube would not cause this fault.

Topic: 41251 Message: 41322

Frequency generator has been set by a reference standard. It also reads correctly on several counters to more than 1ppm, probably 1ppb or better.

The radio came with half the PLL unit, and the counter was broken in several places, really dead.
I rebuilt the entire 820, every board needed attention, and adjusted everything including the PLL etc.... It took it on as a personal challenge, I think I stopped counting after replacing a dozen or so transistors. If I sell the 820, I'll never recoup my expenses. However, ham radio is a hobby, not a business.
I have the readout problem somewhat in line. The 820 readout is close, sometimes a little off received signal.(at least I think so) It behaves quite well an all bands in trans and receive.
I have used it on the hybrid net
Thanks to all for your input.

Del:

When you are have the rig set to Tune Mode, do you get any ALC indication at all?

My first inclination would be to suspect the infamous resistors on the power supply board, but do you gat any ALC?

Robert

41330. TS-820 Speech Processor

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-14 14:02:10 UTC
From: Rick
Topic: 41330 Message: 41330

I am back to square one on the extremely low RF output when the processor is on. With the processor off I get normal RF output. I have replaced Q30 on the IF board as advised but the problem was unchanged. I guess the next step is to trace the signal through its entire circuit until the bad stage is detected. Any and all advise will certainly be appreciated.

73,

Rick / K5IAR

Del has indicated more than once that his 820's IP idling current still
remains at "zero" even after following Joe's suggestion to ensure the
rear panel SG switch is set to ON and the Heater switch is set to ON.

Using different tune up procedures has nothing to do with this problem.

Typically loss of IP idling current is the result of one of the follwing:

1. SG switch is set to OFF
2. Bad Cathode resistors in the final tubes
3. Heater switch is turned OFF

Since Del said he checked items 1 and 3, those 2 items no longer
suspects in this problem.

I recommend Del thoroughly check item 2 since bad cathode resistors can
easily cause an "open" in the final tube's cathode circuit preventing
electron flow in the final tubes, hence "zero" IP idling current. Del
did say he adjusted the bias pot so that's not the problem either.

41333. 262 degree 'Kenwood' style 8 pin Din Plugs

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-14 14:45:00 UTC
From: Ricky Delve
Topic: 41333 Message: 41333

Hi

Retired within the last year and now finally I have some time to pursue a hobby I took my RAE nearly 40 years ago to do.

Having acquired a TS830S and associated accessories I have recently fabricated a lead to connect the external VFO.

Refraining from waffling further I just thought I would like to share for those readers in the UK particularly that the seemingly oft difficult to locate 262 degree Kenwood style 8 PIN DIN plugs can be had presently from the most unlikely of stores at □CoolNovelties.co.uk□. The plugs are listed as □8 PIN "U" DIN MALE PLUG 262 DEG□.

I can confirm having soldered 16 connections to two of the plugs, that they are very good quality and can be bought currently at a very good price of only £1.65 inc. each.

I know this will be of use to anyone who like me has searched fairly fruitlessly to find a country local supply of a plug that actually FITS the socket like a glove..

Why do they sell them?... Hmmm I think they are used in the vintage/retro □commodore□ computer series in which they specialise I was a Microtan 65 and Atari person myself.

73□s

Ricky

Hi Mike, Something to check is the SG Switch. I had problems with my 830. Found SG sw. not working right, went to remove it and it fell apart. I cleaned it and put it back together and all is WELL. Just a though.

The manual says to be sure the shield is in place and the ground strap is
under the shield. I can't remember the page, but it's in the service manual.

Hi Bob.. are they the slip one type that do not require a special tube socket to hold them on. I wonder if you have a picture of them you could send?

Thanks,

Rick/K5IAR

I think that the most important aspect, aside from the actual shielding of the tube, is that if the ground strap is not under the tube then it is likely to contact somewhere it should not be.

The TS-820 Service Bulletins say that the ground strap not being under the tube shield can be a cause of an intermittant transmitter.

41346. DFD2 display installation into TS-820

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-15 19:13:10 UTC
From: bbrummans
Topic: 41346 Message: 41346

I just got finished with installing a DFD2 display from Neil (www.aade.com) in my TS-820.
Note it is not as "S" version, so it did not have the display in it.

For those that have the TS-820 (or 530) with a failed OEM display, replacing the display is a bit if work, but well worth it.
The biggest problem is the replacement lcd, it is not going to fit without modifying the front panel.
I've looked for smaller lcd displays to use, but found none.

With the lcd display, the front panel has to be cut to make it fit.
Not only that but the original status led's for "Att,Fix,Vfo,Rit cannot be used (due to lack of space).

I used some small LED's and wired them directly behind the panel.
I'd post some pics but am not sure how.

If you'd like to see the result, send me an e-mail and I'll send some pics of the install.
(cocobean64@...)

Topic: 41347 Message: 41347

I had a friend become a silent key last year who was in the middle of a recap on this radio so it is in pieces.

He purchased new caps and tubes: 12by7a and a matched pair 6146W still new in the box.

I was there watching so I know where he was in the recap procedure and those board that have not been recapped will come with the new caps. When he started he separated the caps and put those in containers with the individual boards they were to go into.

This radio worked prior to the procedure, he wanted to restore this radio so he could have it for years to come, it is unfortunate that he will never have that pleasure.

Email me off list with your needs and offers and I will get back to you as soon as I can.

41351. Re: [TS-520_820_530_830] Re: WTB Slip on tube shield for 12BY7A

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-15 22:18:28 UTC
From: Mike
Topic: 41336 Message: 41351

Rick,

You can't get to the group's file section using your e-mail program. You have to log into the Kenwood Yahoo Group's home page. Copy the link below into your web browser's address bar.

http://groups.yahoo.com/group/TS-520_820_530_830/

You can't access the Files section until you log into the Yahoo Kenwood Group's homepage.

When the page comes up, look at the top left of the page, you will see the "Login" link. Click on that and when the login page comes up, enter your username and password then press enter. The username and password are the same ones you use with your e-mail program to get Kenwood Yahoo group e-mails. Hopefully you wrote those down somewhere. If you entered the correct username and password, the Kenwood Yahoo Group's homepage will come up.

Once the home page comes up, look on the upper left and you will see a "Files" link, click on that and you will be taken into the Files section.

To log out of the Kenwood Yahoo Group's page, look at the upper left of the page and you will see your log in name. Click on that "once" and a drop down menu will appear. Click on "Sign out". That's all there is to it.

Thanks Robert,

I disconnected every output except the 12.6 volt. When I pluged it in and turned it on....no frying noises and no smoke.....it just sat there quietly.....I think I found part of the problem though.......it looks like the filter caps are wired wrong.....apparantly the last person to have this rig monkeyed around inside and didn't run the other cap to ground.....there is one cap lead that isn't connected to anything!..I'm gong to use the wiring layout that Ken has on the filter cap replacement instructions and get them hooked up correctly and see what happens on the HV side of things.....this will be after I check the transformer voltages......I do have a replacement transformer fi I find one of the windings smoked.

Thanks for the help......I'll let everyone know how things progress...

73,

Kevin O'Dell, N0IRW

It didn't have the tubes in it, no final cage, no power plug, no fuse and only about 3 screws holding the case together.....but otherwise seemed clean. I got a power connector and built the power cable. Built a final cage out of roof flashing (LOTS of holes drilled). Got the 4 mm screws at the hardware store for the case. Got a new 12BY7A driver at a hamfest this past weekend. A matched pair of Taylor 6146B's will arrive tomorrow from RF Parts. 6 amp 3AG fuses will also arrive tomorrow from Mouser.....So, this afternoon with a 5 amp fuse in the holder I plugged it in and flipped the switch.....all the lights came on as did the display. It had

a LOUD 60 cycle hum in the audio and after about 45 seconds or so, there was a frying sound and some smoke started coming out of the rear. I powered down and unplugged. After waiting about 30 minutes, I pulled the covers and flipped it on its top....plugged back in and turned it on again...after the requisite 30 or 40 seconds the frying started and the smoke came out from under the windings of the power transformer...Upon closer inspection, the wires from the power plug have been hot before. So, I obviously have a problem in the power transformer. I have located a replacement (same part number) transformer and have ordered it. The next question is what is causing the transformer to fail.......bad caps, or what?? Also, what is the proceedure for changing out the transformer??

41354. TS-820S - Low power on 160 Meters

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-16 04:18:02 UTC
From: Roger
Topic: 41354 Message: 41354

Hello All,

I have a TS-820S that I have been repairing and the one final issue that I have is low output power on 160 Meters. The radio tunes up fine on all other bands, putting out a good solid 100 Watts.

I have good level of ALC and the idling current seems fine on 160 Meters, but I cannot get any dip of IP when adjusting the plate control in tune or CW mode. Also, in CW mode I get the full 225 ma, but only about 25-50 watts out. It is almost like there is something amiss in the final tank circuit or something, but I can't seem to find the issue. (Or, perhaps this is just my wrong thinking...)

Any suggestions/ideas would be appreciated.

Thanks and 73,

Roger (AE3RT)

From: roberteleazer@rocketmail.com
Topic: 41318 Message: 41355

Kevin:

I can believe that! I am working on a TS-520 that has serious power supply problems - as in smoke. A previous owner apparently had been troubleshooting it, cut all the power supply wires to isolate the problem, and then hooked them back up, using jumper wires. In the process he had connected the HV directly to one of the 100uf 500V caps with no rectifier in between the two. I spotted that right away and disconnected it, so that was not the source of the smoke.

I am in the process of replacing all of the power supply components, including the whole rectifier board (the source of the smoke), the resistors on the small HV board, and all of the HV caps. I am not going to power it back up until the caps are replaced - although after removing them I have found none that seem to be bad, they all hold voltage very well.

Good Luck to both of us!

Robert

To: TS-520_820_530_830@yahoogroups.com
Subject: Re: [TS-520_820_530_830] Re: WTB Slip on tube shield for 12BY7A

Rick,

You can't get to the group's file section using your e-mail program. You have to log into the Kenwood Yahoo Group's home page. Copy the link below into your web browser's address bar.

http://groups.yahoo.com/group/TS-520_820_530_830/

You can't access the Files section until you log into the Yahoo Kenwood Group's homepage.

When the page comes up, look at the top left of the page, you will see the "Login" link. Click on that and when the login page comes up, enter your username and password then press enter. The username and password are the same ones you use with your e-mail program to get Kenwood Yahoo group e-mails. Hopefully you wrote those down somewhere. If you entered the correct username and password, the Kenwood Yahoo Group's homepage will come up.

Once the home page comes up, look on the upper left and you will see a "Files" link, click on that and you will be taken into the Files section.

To log out of the Kenwood Yahoo Group's page, look at the upper left of the page and you will see your log in name. Click on that "once" and a drop down menu will appear. Click on "Sign out". That's all there is to it.

[Non-text portions of this message have been removed]

[Non-text portions of this message have been removed]

41357. Re: [TS-520_820_530_830] Re: WTB Slip on tube shield for 12BY7A

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-16 18:19:32 UTC
From: Mike
Topic: 41336 Message: 41357

You're welcome Rick.

The procedure I gave you is also how to change your membership settings.

If, for example, you no longer wish to receive group email postings and response via e-mail. You use the same Yahoo Kenwood Group log in procedures stated in my previous response.

After logging in and the Kenwood Group's homepage comes up, look at the top of the page and you will see a link titled "Edit Membership". Click on that link and when the Edit Membership page comes up, scroll down to the bottom of the page and click on the radio button titled "Web Only". Next, click on the bottom right icon titled "Save Changes". From then on you will no longer receive Group e-mails, you will have to log onto the Kenwood group's home page to view and respond to posts and submit responses.

I've seen a lot of group members who appear to have problems unsubscribing using the "Unsubscribe" link at the bottom of "every" group e-mail. If the link isn't working, for what ever reason, simply use the procedure outlined above and it will do the same thing, stop group e-mails from the group server from being sent to the member's e-mail address. This is assuming the member(s) only wants to stop receiving group e-mails but remain a group member.

Use CAUTION when using the edit membership page, once you have made the changes you want, click ONLY on the "Save Changes" icon on the bottom right of the page. Do NOT click on "Leave Group". If you click on the "Leave Group icon, you will asked if you want to leave the group and if you click Yes then you will no longer be a group member and you will have to reapply for group membership to participate in group posts and response.

[Non-text portions of this message have been removed]

41358. Re: TS-820S - Low power on 160 Meters

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-16 18:21:11 UTC
From: Roger
Topic: 41354 Message: 41358

Some additional information:

1) There is a dip in IP when adjusting the load control, which is very, very slight (almost unnoticable; I missed it earlier).

2) The dip occurs with the plate indicator counterclockwise, below the end of the band for the 3.5 MHz range, not in the 1.8 MHz range on the panel scale.

3) You get max power with the load control completely counterclockwise.

4) As noted before, IP stays right at 200 to 210 mA (after dipping and no matter where the load control is positioned). HV appears to be right around 800 Volts on the panel meter.

4) The max power is right at 50 Watts when carefully tuned for the dip in IP and in CW mode.

5) I checked the ALC/Drive alignment as instructed in the manual and everything was pretty much right on.

Please let me know any thoughts, suggestions, etc...

Thanks and 73,

Roger (AE3RT)

>
> I have good level of ALC and the idling current seems fine on 160 Meters, but I cannot get any dip of IP when adjusting the plate control in tune or CW mode. Also, in CW mode I get the full 225 ma, but only about 25-50 watts out. It is almost like there is something amiss in the final tank circuit or something, but I can't seem to find the issue. (Or, perhaps this is just my wrong thinking...)

Thanks, Mike.

rick

You're welcome Rick.

The procedure I gave you is also how to change your membership settings.

If, for example, you no longer wish to receive group email postings and response via e-mail. You use the same Yahoo Kenwood Group log in procedures stated in my previous response.

After logging in and the Kenwood Group's homepage comes up, look at the top of the page and you will see a link titled "Edit Membership". Click on that link and when the Edit Membership page comes up, scroll down to the bottom of the page and click on the radio button titled "Web Only". Next, click on the bottom right icon titled "Save Changes". From then on you will no longer receive Group e-mails, you will have to log onto the Kenwood group's home page to view and respond to posts and submit responses.

I've seen a lot of group members who appear to have problems unsubscribing using the "Unsubscribe" link at the bottom of "every" group e-mail. If the link isn't working, for what ever reason, simply use the procedure outlined above and it will do the same thing, stop group e-mails from the group server from being sent to the member's e-mail address. This is assuming the member(s) only wants to stop receiving group e-mails but remain a group member.

Use CAUTION when using the edit membership page, once you have made the changes you want, click ONLY on the "Save Changes" icon on the bottom right of the page. Do NOT click on "Leave Group". If you click on the "Leave Group icon, you will asked if you want to leave the group and if you click Yes then you will no longer be a group member and you will have to reapply for group membership to participate in group posts and response.

41362. TS-520S - Losing output power & receive during tune procedure

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-17 11:54:30 UTC
From: cl5ltd
Topic: 41362 Message: 41362

I have just purchased a TS-520S radio and when it has been working it operates very well with excellent signal & audio reports. MY first boat anchor!

However there is an intermittant fault which is occuring anytime from power on to after several hours of operation without warning.

It seems to occur mainly If I have moved frequency or changed bands and retuning. when I go through the tune procedure and am adjusting the drive control to bring output into the ALC range, as I adjust the drive control, the output abruptly dissapears and when I come out of send mode, the receive is virtually gone as well.

This is occuring on all bands but not all the time. It can run exactly as expected with several band changes & tune ups.

A power on /off cycle brings the radio back to life. It will receive fine for hours but ss soon as I go to tune or transmit, the same problem occurs.

I created a 1 minute youtubde clip to demonstrate what is occuring
http://www.youtube.com/watch?v=xtAjPDeFAWU

Has anyone in the group experienced this type of fault?
Any suggestions of what the first steps are to identify and resolve this fault?

A local experienced boat anchor operators first thought was power supply area. He suggested put the question to the collective wisdom of the group and gather feedback - suggestions as to most likely causes and initial checks to make

In the Tune position and meter in ALC you want to
peak the drive for max meter reading. The meter
ALC comes into play when your transmitting on
SSB. You want to keep the modulation average
within the ALC range on the meter.

Here is a good write up on the subject:

http://www.k4eaa.com/tune-up.htm

Good luck,
Mark

The fact that the problem seems to occur just after you have changed frequency on one band or switched to another band tends to make me suspect the VFO.

The Kenwood Hybrids have a endemic problem with VFOs's now that they have gotten old. They get dirty inside and you will hit a spot where the the tuning cap either shorts out or does not connect to the circuit, which causes the VFO to either go dead or jump 500 KHZ. If teh VFO goes dead then the rig will neither transmit nor receive.

The only sure fire way to fix this is to yank the VFO, take the can off, clean the tuning cap with an electronic-compatible cleaner and then lube the pivot points with something like LPS-1.

Now, it is possible that dirty contacts in a switch or loose contacts on a board connector will cause this as well, but I do not see an obvious connection to the act of changing frequency with those problems.

Another thing you might do is go over to the Group files section and look at the TS-520 Service bulletions for a clue to the problem.

Good Luck!

41366. Re: TS-520S - Losing output power & receive during tune procedure

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-17 18:23:55 UTC
From: k5hfg
Topic: 41362 Message: 41366

Christopher,

When you tune up per, Kenwood manual, you first peak your drive for max ALC reading. If it is out of the ALC range on the meter you can adjust it with the carrier control. After that you should not need to touch the drive knob again unless you change to great a freq. jump or change band. I watched the video. Give it a try without changing drive setting after it is tuned. Dip the plate with the plate control and then adjust Ip with the load control. I want to know what happens when you do it that way. Always monitor your Ip when operating your 520 and keep Ip below 225 a and you will enjoy years of fine radio operation.

41367. KENWOOD HYBRID USER NET (March 17th, update)

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-17 18:28:52 UTC
From: mvgilger
Topic: 41367 Message: 41367

The Saturday's net on 40 meter we had 21 stations checking with good band conditions. There were 3 new stations checking in. Out of those, there was:

6 running TS-520(x)
1 running TS-530(x)
7 running TS-820(x)
0 running TS-830S

I was running my TS-940s. The rest were running non hybrids of one model or another.

Today was the first time since the net started up that there were more TS-820's check in than any other radio. Pretty good to have 7 of those check in.

The Sunday's net on 20 meter we had 8 stations checking in under poor band conditions. Out of those, there was:

4 running TS-520(x)
1 running TS-530(x)
0 running TS-820(x)
3 running TS-830S

I was running my TS-940s. The rest were running non hybrids of one model or another.

We have been having several people checking in regularly with their TS-430, TS-440, and TS-940's, which of course is not a hybrid, although over 30+ years old. Everyone is welcome as long as they have an interest in the older equipment.

If anyone would be interested in filling in as a net control station, please send me an email. Currently it's just myself, WB2KNR and WB0SGA. I would like to get several more. If we do, we can alternate so everyone might be on a 3-4 week rotation. It's a lot of fun and a good way to make sure you station is optimized.

For anyone that has not heard, we have a new web site that WB4HFN is hosting. He currently has a very nice site for Drake, Collins and Heathkit and now Kenwood Hybrids. Good quality manuals plus sale flyers and brochures will be found here, along with user supplied information for all Hybrids.

His URL is:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

To date, we have had the following check-in:

Nov. 2011 ☐ Oct. 2012 Saturday total 754 check-ins, Sunday total 563 check-ins

November 2012, Saturday's, net total = 47, Sundays total = 20
December 2012, Saturday's, net total = 74, Sunday's total = 70
January 2013, Saturday's, net total = 93, Sunday's total = 87
February 2013, Saturday's net total = 103, Sundays total = 87

March 2013, Saturday's, net total = 89, Sunday's total =26 (Month to date)

Net Info:
Saturday: 7.235 @ 3:30 Eastern following the Swan Tech Net
Sunday: 14.316 @ 1800 UTC following the ICOM net

Web Site:
http://www.wb4hfn.com/KENWOOD/KenwoodHomePage.htm

73's,
Mark, WB0IQK

Mike,

More than likely they are: 2(two)   10 ohm 1watt 5% ....cathode resistors

2(two)   100 ohm 1/2 watt 1%.....screen resistors

Injury to these resistors is not uncommon, especially if rig has been really abused, usually from prolonged tune-up times...QRO mods., etc.
Take a look at the plate choke...the round thingy between the final tubes...the fine wire winding should be relatively "copper" colored. IF, it's dark or,
burned looking this indicates severe overload and there may be other damage other than the above mentioned resistors.

Check also the 470 ohm 1 watt resistor on the rectifier board also.
I also suspect that the final tubes may also have suffered damage....suggest that you obtain a known good set...along with a know good driver.

Mike,

It appears you do not have the 520 service manual. You should not attempt to service the 520 without the service manual. The values of the resistor in question are listed in the service manual plus shown on the service manual's schematic.

You can download the manuals, operator and service manuals, for the 520/520S/520SE at the following link

www.n6wk.com/kenwood/

The TS-520SE is basically the same as the TS-520S except the 520SE does not have the ability to operate from 13.6VDC using the DC to DC converter. Therefore, the service manual for the TS-520S will work for the TS-520SE.

Hi Christopher,
After viewing your video clip, I am not seeing where you actually tune up the radio. All I saw was that you adjusted the load control until you had zero ALC deflection. There are lots of tune-up procedures to be found in the files section, but I think your radio may also have the symptoms of dirty relay contacts. I would suggest that you clean both of the relays if the loss of receive sensitivity continues after you get the tune-up mastered. Good luck, the radio almost looks like it just came out of the box.

Hi MIKE and THANKS. I do have the TS-520 service Man. BUT, it does NOT show that 2 each resistors are "twisted" to make one resistor of a certain value. So, these being TU I could not guess why this was done or if someone had done this at a later time for whatever reason. Thanks for your reply on my project.

Hi Joseph, THANKS, I have a new driver, and replaced the 470ohm res. on the rectifier bd. I have a new set of 6146's and used a final cage "repair kit ie; 2 caps & RF Choke. Just wasn't certain about the resistors I wrote about. I bought this TS520SE at an estate sale. NO TRANSMIT. Good cond. except, that. I have a great TS-520 and is my primary HF radio. Although I did buy a new ALINCO DX-SR8 just 3 weeks from Gigaparts to use QRP CW and digital modes (new too me). Thank you,again

Jay, Good Pick Up !
I should have said I'm adjusting the DRIVE control - I don't actually touch the LOAD control at all. So it's while I'm adjusting the DRIVE control that output suddenly disappears and when I flick out of send, receive is nearly dead until I do a power cycle.

--- In TS-520_820_530_830@yahoogroups.com, "kb9wwq" <kb9wwq@...> wrote:
>
> Hi Christopher,
> After viewing your video clip, I am not seeing where you actually tune up the radio. All I saw was that you adjusted the load control until you had zero ALC deflection. There are lots of tune-up procedures to be found in the files section, but I think your radio may also have the symptoms of dirty relay contacts. I would suggest that you clean both of the relays if the loss of receive sensitivity continues after you get the tune-up mastered. Good luck, the radio almost looks like it just came out of the box.

Thanks for the responses thus far. I have now followed the K4EAA procedure to the letter and the fault occurs just the same. I don't get as far as the CW tune due to the fault occuring.

So I'm confident with the tune up procedure. At first I suspected I was doing something incorrectly but this is not the case.

I should point out, this problem is mostly occuring during tune up process but HAS happened during a SSB QSO also without warning.

After a 10 minute warm up this morning, the fault presented as soon as I went to adjust the drive control. This is after an overnight shutdown. The the fault displayed as soon as power is adjusted in tuning or drawn during transmission. So after overnigth shutdown-overheating is not a factor

The fact that receive virtually shuts down and I need to do a power cycle to bring it back seems to point to a power transmission problem which requires power off/on to rectify.

When Using a dummy load, the fault presents just as with resonant antenna.

I'm by no means a radio tech person but understand fault finding is an process of elimination, observation, measurement and patience!

All I have done so far is make sure the valves are properly & firmly seated.

Mike,

  Glad I could help. One other note: use the same ohm & especially the same wattage rating as originals!
                                The 10 ohm resistors should be R's 2 & 3,   R's 5 & 6 should be the 100 ohm on the schematic
                                I sub metal film for these when I can.

41383. DRIVE/ALC

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-19 02:03:57 UTC
From: Rick
Topic: 41383 Message: 41383

When loading my TS-820 after a 5 minute warm up I get no indication of "Drive" on the meter when it's in the ALC position as it should be. The inline wattmeter shows about 30 or 40 watts and when I switch the meter to Ip I have indication on the meter and the transmitter dips as it should and loads to about 60 watts, however, the drive is a little low until it warms up about an hour. Anyone encountered this problem?

Thanks,

Rick / K5IAR

41385. Re: TS-820S - Low power on 160 Meters

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-19 01:48:26 UTC
From: Roger
Topic: 41354 Message: 41385

I ended up replacing L1, C1 and C2; they showed signs of damage/overheating. Also replaced L3 because of a defect in the way it was constructed. (I have a unrepairable TS-520S that gladly donated the parts.)The radio now tunes up on 160 Meters and puts out full power as it should.

I have a few additional questions for the group.

What is an normal acceptable range for the 800V, 210V and 300V in the TS-820S? My voltages seem a little high to me, but there does not appear to be any signs of modifications in the circuit.

Also, the idling plate current is around 70 ma with the adjustment turned the whole way down, which also seems a little high. Is that normal?

Thanks and 73,

Roger (AE3RT)

Topic: 41285 Message: 41386

Surely someone out there can help this old ham? Might this be an adjustment of VR3 or VR4? The S-meter with the antenna attached to a dummy load reads an S-3 with the RF control fully clockwise. Any ideas Please? As I mentioned earlier the meter functions consistent with levels but reads high on the S-meter and the ALC function. IP and RF functions read correctly.

TNX
Dave

Topic: 41372 Message: 41387

Hi Mike,

Okay on having the service manual and schematic. As I said, one can't work on/repair/troubleshoot electronic equipment without the service manual and schematic. I see a lot of members asking questions about problems they are having and what course of action they should take. More often than not, the member does not have the service manual and schematic. That is why I mentioned you need the service manual and schematic before attempting to service your 520SE.

It's not important, at this point, what each resistor's value in each "twisted pair" is. You can determine that later (see example below). What you should be doing is focusing on the final amplifier's resistor values for R2 and R3 in the final amplifier which both are 10 ohm 1 watt resistors a piece, to fix the problem, assuming there are no other problems than the burnt out/open twisted pair of resistors. Since the resistors are burnt open, I would also consider one or both of the final tubes may not be up to par. But first, replace the cathode resistors with "correct" resistor values and power ratings as indicated on the schematic. If you don't have the correct value and power rated resistors on hand, order them. Don't go the "easy route", be lazy just to save a few pennies, order and install the "correct" part(s).

You wondered what the value of each resistor is in each of the "twisted pair" is. I suspect the value of each resistor is more than likely 20 ohms. That means the twisted pair of resistors are connected in "parallel". Looking at the schematic, which is what you should be doing, you will notice that the individual resistors are labeled "R2 and R2" with a value of 10 ohm at 1 watt "each".

What appears to have happened is a previous owner did not have any 10 ohm 1 watt resistors on hand so they simply connected two 20 ohm resistor together to achieve the 10 ohm resistance needed. You use the formula for pairs of parallel connected resistors which is:

RT = R1 x R2 / R1 + R2

or

20 x 20 / 20 + 20 = 10

Since you have 2 pairs of twisted resistors that total 10 ohms each pair, the total resistance is 5 ohms. Use the same formula by simply substituting 20 with 10, see below:

10 x 10 / 10 + 10 = 5

You can use the same formula for 3 or more resistors connected in parallel, simply divide up the resistors into "pairs". For example, if you have 3 resistors, 10, 20, and 30 ohms, connected in parallel. What will the total resistance be? It will be 5.454 ohms.

I divide up the resistors in pairs, first I use the 10 and 20 ohm resistors to achieve an answer which will be 6.666 ohms

10 x 20 / 10 + 20 = 6.666

The 6.666 "answer" to the first pair now becomes a resistor value I pair up with the last 30 ohm resistor which results in a total resistance of the 3 resistors in parallel of 5.454 ohms

6.666 x 30 / 6.666 + 30 = 5.454

Hi Dave..

Mode switch is set to TUNE

Frequency is 14.275 MHz

Yes, this was all done into a dummy load, however, I tried it into my antenna and got the exact same results.

CAR control set at 12:00

I'm not sure you mean "..id your rig in title". It's a TS-820.

Thanks for any help you can offer.

41390. Power Transformers for Hybrids

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-19 16:29:34 UTC
From: Bob
Topic: 41390 Message: 41390

I have quite a few Power Transformers that need new homes...
All clean & functional with no burnt smells...
Normally sell them for $50 plus $12 to mail by Flat Rate Priority...
Will offer to group for $40.00 each, plus $12.00 to mail...
I can mail two transformers for $35.00 each & can mail 2 for $12.00...
Contact me privately off the group...
Bob

41391. VFO for Kenwood TS-830S.

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 41391 Message: 41391

Hello. My name is Mark(KI4OJG) with a vfo issue. I need to find a replacement internal VFO unit for a very nice TS-830S transceiver. The vfo unit pretty much locked up,But will rock back and forth. The manuals seem kind of vague about the inner workings of vfos. I would appreciate any advice,technical information or a replacement vfo source concerning this subject. This rig is too nice to give up on. Thanks DE KI4OJG.

41392. Transmit audio hum with hand held mic

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)
Date: 2013-03-19 18:37:05 UTC
From: John Donnelly
Topic: 41392 Message: 41392

A question for the group:

I've got a TS-830s gold medallion that has moderate hum on transmit. I'm using a hand held mic that I believe was made for a TS-520. It measures
500 ohms with a multimeter. The two pins for the keying switch on the mic are not connected to either mic element lead.

If I key the transmitter with the send switch, and the mic disconnected, the audio is clean. Will getting an MC-50 solve
this problem?

Thanks Rick. Adding "TS-820" in the Subject line allows quick sorting amongst lots of emails for different models.
Maybe Gordon / Mike can advise on this one.

Jack,

I suggest that you confirm the wiring from the mic to the 4 pin plug. You can look at the rigs "operators manual" or go to: k4eaa.com
This web site belongs to Ken Kemski. There is lots of good info there, including proper wiring of microphones.

Mark,

I have not seen a VFO fail as you described, unless of course, being dropped to otherwise wacked. Removal of the VFO is rather easy. You will need to remove the 4 allen screws on the front of the VFO....they are 3mm. SLOWLY...pull the VFO out. There will be 2 lights...one on either side... and a plug at the rear that will have to be removed. You can then inspect the gear train. I know of only one person that may have a replacement: Bob Mansker.....you can email him at: ke5ftf@... I have dealt with him numerous times...he is honest and, the prices fair.

Gordon, Butch Lewis (KØPSA) here. Do you think Mark's VFO issue could be a dirty VR-4? You may recall that a couple of years ago I bought a very nice TS-530S with an unstable VFO. The original owner who sold me the radio thought it needed a new VFO. Your recommendation to me was perform step one in the adjustment section. The voltage bounced from under 8v to occasionally just over 11v. Just exercising VR-4 and setting the voltage and solved the problem. It has been stable ever since. Just a thought.
73s,
Butch Lewis

I have a friend (WD6FFF - Jerry Durham) that has a TS-950SDX that he needs to ship to Clif at aVVid..problem is, he has no factory box and packing for the radio...and Clif won't accept the radio unless it is in a factory box.

So.....

Does anyone here have a 950SDX box that Jerry, can buy or borrow to get his radio down to Clif in Texas?

(BTW..Jerry is in Copperopolis, California)

Thanks!!

That is the first thing I would do. While you have it out go over all the solder joints and clean it up. Works wonders. You can get a replacement if needed but unless they have been very badly treated they usually respond well to a cleaning and good check. Sound wisdom.....

Hello Jean

I checked my TS-511S cable, these are TOCON brand connectors.
I could not find a model number.
I did find a possibility on E-BAY item number 160812987616.
Hope this is a help if not let us know and we will try again.

Jack:
I agree with going over the wiring on the mic.
Make sure the wiring is correct.
There are two different "grounds" for the mic, one for the element and one for the PTT.
Then check the mic wire. Possibly replace it.
I don't know the mic you are using but some mics need good grounding. Otherwise they act as RF feedback antennas.
I had a similar problem with a D104 on a 520, which is obviously not the mic you are using.

Good morning Jean

I used that item number and went right to it but no problem.
This listing is by W5CIA in US. Item number is 160812987616 copied from listing.
I have had problems looking into Irish and English Ebay, not sure why???
These look possibly what you need but the socket side is for chassis mount.

I've confirmed this is an original KW hand held that came with a 520. It is wired correctly and the grounds are isolated as they are supposed to be.
Is there a problem with impedance? The hand held is a 500 ohm unit and I believe the S-830 is a high impedance input.

Hi to all. On the subject of mics, I put a Shure cartridge into a Motorola mic and added a 4-pin connector. It works well with my TS-520 but I found that background noise is noticeable. This includes shifting my grip on the mike or squeaks from the PTT switch. I tried a bit of plastic foam inside the mic case and that helped but not very much. Would anyone have a suggestion for better packing?
Thanks & 73.

GM, I was out of town Tuesday so just this morning I'm catching up on my mail. Those "twisted" resistors were 1ea, 100 ohm & 10 ohm. While in the area of Johnson City, Tn. I obtained the correct "metal film" resistors. I have already obtained a "final cage" repair kit on line. They are 1ea. .001 10kv doorknob cap. 1ea .01 2kv cap. and a 6.8uH 500ma RF choke. A new driver, 2ea 6146s. I will continue, later. Good to hear from you.

Hi Mike, I don't understand why previous owner combined a 100 ohm with a 10 ohm resistor where clearly there should have only been a 10ohm at both R3 & R4, only. The only place the drawing shows there should be an 100ohm is at R2 & R6. Any guess? Thanks.

Mike,

Connecting a 100 ohm and 10 ohm resistor in parallel results in a total resistance of 9.09 ohms (100 x 10 / 100 + 10 = 9.09). It appears a previous owner of your 520SE had no clue how to calculate resistors connected in parallel, especially if those "twisted" resistors were made up to be used in the final tube's cathode circuit.

A "10KV door knob" cap for a TS-520SE? Where did you buy this "final cage" repair kit and did you tell the seller you were referring to a Kenwood TS-520SE hybrid transmitter final amplifier? I have never seen a "10KV Door Knob" capacitor, from the factory or from a previous owner, mounted in the final amplifier of any Kenwood hybrid.

What makes you think you have to perform a "final cage repair" in your TS-520SE final amplifier? What troubleshooting steps did you take that produced results that clearly stated you need to replace all of these components, and to install a "non-standard, non-Kenwood design" 10KV .001 Door Knob Capacitor in your TS-520SE final amplifier?

Topic: 41410 Message: 41410

Does anyone happen to know the approximate impedance of L1 in the final cage? Mine measures .47 ohms.

Thanks,

Rick/K5IAR

Topic: 41362 Message: 41411

After a few more days of observation, the fault is evident more often than not and all output power was lost during a QSO today (30 mins from power on) - frustrating as I can't rely on the radio to transmit when I might need it.

Changing bands certainly has an immediate effect as you need to re tune and the power just drops as soon as drive is adjusted

As a receiver though, I am amazed at the quality & clarity of the audio - even without an external speaker it is rich and smooth

Any further thoughts?

GM MIKE, THANKS FOR YOUR HELP!! THE FINAL CAGE " REPAIR KIT" WAS OBTAINED ON EBAY FROM A POPULAR REPAIR PARTS SITE. ONLY 3EA COMPONETS, SO I ORDERED THEM AND INSTALLED THE NEW REPLACEMENTS. LOCATIONS WERE C7,C8, L1. THE REASON WAS LOW POWER ACROSS ALL FREQS. SITE IS; WWW.HYBRIDRESTORE.COM/FINAL-CAGE-REPAIR/. REPLACED THE 10 OHM RESISTORS AND THE 100 OHM RESISTORS, NOW TO REPLACE THE DRIVER AND THE 6146's and see the results.

BEST 73s and GODS BLESSINGS, MIKE W9MVM

Howdy from snowy Pennsylvania! My first guess is that the radio is loosing one or more voltages in the high voltage power supply. It may be the filament or plate but I'd bet it's one of those. If you operate the rig with the top cover removed and chat until it fails you can dim the room lights and look for glowing tubes on top of the Faraday shield of the driver or through the side vents of the HF cage. If the rig transmit fails and the tubes are lit then it's probably the HV.
Just be careful working around the rig in operation with the top removed!
Later,
73,
Pete WW3O

Subject: [TS-520_820_530_830] Re: TS-520S - Losing output power & receive during tune procedure

After a few more days of observation, the fault is evident more often than not and all output power was lost during a QSO today (30 mins from power on) - frustrating as I can't rely on the radio to transmit when I might need it.

Changing bands certainly has an immediate effect as you need to re tune and the power just drops as soon as drive is adjusted

As a receiver though, I am amazed at the quality & clarity of the audio - even without an external speaker it is rich and smooth

Any further thoughts?

41414. Drive at the high end of 75 meters.

Yahoo group: TS-520_820_530_830 (2013-01 — 2013-07)

Topic: 41414 Message: 41414

Hi to all.
I have a TS-520 that works very well except at the high end of 75 meters. The normal drive level is indicated on the meter in normal tune-up up to about 3.75 MHz. From there on up the needle will drop off gradually to zero at about 3.82 MHz. All the other bands show normal drive levels at both ends. Power output is normal when the drive is tuned up.
I just obtained this rig from QTH.com and it is excellent in every respect except this. I've changed driver tubes and the trouble is there with both of them. It appears that the coil pack associated with 75 meters needs adjusted. I have the operating and service manuals but they have no guidance about this.
Would anyone have an idea how to resolve this problem?
Thanks & 73,
Pete WW3O

Does this occur right after you let up on the transmit key?

If so, it's probably a relay.

Please, forgive my error. It was brought to my attention I had misstated what I wanted to know. I, of course, meant "DC resistance", not impedance. Some days my brain refuses to cooperate with me. HI

Thanks,

Rick/K5IAR

Does anyone happen to know the approximate impedance of L1 in the final cage? Mine measures .47 ohms.

Thanks,

Rick/K5IAR

Hi Mike,

I mean on disrespect but replacing the original components in the final amplifier with the parts from the final cage repair kit (C7, C8, and L1) you purchased on eBay, followed by replacing final tube cathode resistors (2 x 10 ohms 1 watt) followed by replacing the final tube screen resistors (2 x 100 ohm 1/2 watt), followed by replacing the driver and both final tubes, all in one fell swoop without any testing done between component replacement. Unfortunately, you cannot, with any certainty, say which components in the kit, the driver tube, or both final tubes, were actually the source of your problem.

This is where proper troubleshooting technique play a big role in tracking down the source of a problem and why replacing multiple components in a "Willy Nilly" or "shot gun" approach without performing any troubleshooting is a bad idea.

Ebay for sure. There's a set of tubes (incl. 12BY7) for $63;
See Ebay Item #: 190705524288

Another source is RF Parts (rfparts.com). I got a set of Taylor 6146B's, been quite happy with 'em so far ($49.00/pair)...

http://www.rfparts.com/old_site/6146w.html

RF Parts sells them at various prices. They have a limited warranty of 1 year (see their website at the following link)

http://www.rfparts.com/old_site/6146w.html

I buy all my tubes from

www.vacuumtubes.net

They sell a 6146B for $32 and like all the other tube vendors, they test every tube before they sent it to you. Also, like the other vendors, they offer a warranty on their tubes. I have never received a bad 6146 from vacuumtubes. I purchased 3 pairs of 6146s from vacuumtubes.net 3 years ago and they ALL are still producing full output.

If you go to vacuumtubes.net's website click on the "Price list" link then select "6000 through 7999" link and scroll down to the 6146B 6146B/8298/8298A. Note the next line is a "Chinese" tube, 6146-CH for $20.00.

Hi Mike, I know what you are saying is correct. I enjoy you email directions. One question. Is it necessary to go through the neutralization procedures if installing used 6146's if the the used tubes check-good.?? or only installing new 6146's?? Thanks.

BEST 73s and GODS BLESSINGS, MIKE W9MVM
